The Silver Star Medal was recently presented to Lieut. Ralph Atkins Foster, formerly of Yakima, Wash., "for conspicuous gallantry and intrepidity while serving with a Marine raider battalion during an engagement with enemy Japanese forces on Bougainville Island, Solomon Islands, Nov. 1, 1943. Landing on the beach among the first assault waves, Lieutenant (then Lieutenant, Junior Grade) Foster immediately went to the aid of men wounded by a hostile artillery shell which exploded in their landing craft. In full view of the enemy he worked tirelessly for more than an hour, caring for the injured while the Japanese kept up a continuous fire and grenades struck within 10 yards of his post. With utter disregard for his own safety he steadfastly remained in his hazardous position until he had treated all of the wounded, thereby contributing to the saving of many lives which otherwise might have been lost. His cool courage, outstanding professional skill and unswerving devotion to duty were in keeping with the highest traditions of the United States Naval Service." Dr. Foster graduated from the University of Oregon Medical School, Portland, in 1938 and entered the service Nov. 15, 1942.

Lieutenant Commander Robert L. Griffith

For exceptional efficiency as senior medical officer in directing his medical staff aboard an attack transport during the capture of Japanese held Saipan and Tinian Islands, the Bronze Star was recently awarded to Lieut. Comdr. Robert L. Griffith of the Public Health Service of the Federal Security Agency. The citation read that, "working zealously with the limited facilities available, Lieutenant Commander Griffith was responsible for the prompt and skilled treatment of more than a thousand casualties taken aboard during the combined operations. His exceptional efficiency in directing his medical staff throughout long hours without rest was a contributing factor in saving the lives of men wounded in combat and reflects the greatest credit on the high professional integrity of Commander Griffith and his gallant devotion to the fulfillment of a vital mission." Dr. Griffith graduated from Harvard Medical School, Boston, in 1936. He received a commission as assistant surgeon in the regular corps of the Public Health Service in 1939. Prior to his assignment to the overseas theater of war with the U. S. Coast Guard, Dr. Griffith was stationed at the Marine Hospital, New Orleans.

MISCELLANEOUS

IMMUNE SERUM GLOBULIN

Immune serum globulin (gamma globulin) for the prophylaxis, modification and treatment of measles is now available for the civilian population through an appropriation by the American Red Cross as announced by Mr. Basil O'Connor, chairman of the Central Committee of the American Red Cross. This action is in keeping with the policy of the American Red Cross to return to the American people, as far as practicable, any useful blood derivatives accumulated in excess of military needs as a result of its blood donor program.

The serum globulin will be supplied without charge to state and territorial health departments or local health departments where biologic products are not supplied by the state, provided the globulin will be distributed without charge to physicians, hospitals and clinics, and provided it will be administered in accordance with established standards and without any charge to the patient for the globulin.

As announced in the July 1, 1944 issue of *THE JOURNAL*, health departments assumed the costs of processing and distributing immune serum globulin. Under the new plan the entire cost of processing and distributing the product is now borne by the American Red Cross.

The crude serum globulin fraction thus made available is derived as a by-product from processing serum albumin under Navy control. It has been declared surplus and assigned by the Navy to the American Red Cross for distribution.

Eligible health agencies are being requested to place their orders promptly with National Headquarters, American Red Cross, Washington, D. C., attention of Dr. G. Foard McGinnes, National Medical Director.

WARTIME GRADUATE MEDICAL MEETINGS

The following subjects and speakers for Wartime Graduate Medical Meetings have just been announced:

California

Birmingham General Hospital, Van Nuys: Chemotherapy, Dr. Clinton Thienes and Lieut. Comdr. Charles Bingham, March 14.

U. S. Naval Air Training Station, San Diego: Internal Derangements of the Knee Joint, Dr. John Wilson, March 16.

Station Hospital, Camp Cooke: Fractures About the Wrist and Ankle, Lieut. Col. Richard B. McGovney and Dr. Samuel Mathews, March 21.

Hoff General Hospital, Santa Barbara: Fractures About the Wrist and Ankle, Lieut. Col. Richard B. McGovney and Dr. Samuel Mathews, March 21.

U. S. Naval Hospital, Oceanside: Thoracic Surgery, Dr. John Jones and Lieut. Comdr. J. E. Dailey, March 22.

Illinois

Gardiner General Hospital, Chicago: Dermatologic Diseases, Drs. Stephen Rothman and E. A. Oliver, March 14; Sequelae of Head Injuries, Dr. Paul Bucy, March 23; Burns and Plastic Surgery, Drs. Wayne B. Slaughter and Paul Hausmann, March 28.

Station Hospital, Fort Sheridan: Malignancies in the Army Age Group—Medical X-Ray and Surgical Diagnosis and Treatment, Drs. Alexander Brunschwig and James P. Simonds, March 15; Endocrinology, Dr. Willard O. Thompson, March 29.

Vaughan General Hospital, Hines: Wound Healing and Tendon Surgery, Drs. Hilger P. Jenkins and Alfred Rasmussen, March 14; Mental Hygiene and the Prevention of Neuroses in War, Capt. Charles O. Sturdevant, March 28.

U. S. Naval Hospital, Great Lakes: The Safety of Primary Resection of the Colon, with a Discussion of the Preoperative and Postoperative Management, Dr. Karl A. Meyer, March 20.

Mayo General Hospital, Galesburg: Virus and Rickettsial Diseases—Medical and Neurologic Diseases and Treatment, Drs. Francis Gordon and J. E. Salk, March 14; Psychosomatic Medicine, Dr. Francis J. Gerty, March 28.

Station Hospital, Camp Ellis: Thrombosis, Thrombophlebitis and Anticoagulants in Less Common Peripheral Vascular Diseases, Drs. Geza de Takats and Armand J. Quick, March 14;

Peptic Ulcer, Gallbladder and Liver Diseases, Drs. Lowell D. Snorf and John T. Reynolds, March 28.

Regional Hospital, Chanute Field, Rantoul: Laboratory Diagnosis and Its Relationship to Medical and Surgical Treatment, Drs. Steven O. Schwartz and William S. Hoffman, March 14; High Blood Pressure, Drs. Adrien H. Verbrugghen and Louis N. Katz, March 28.

Indiana

Billings General Hospital, Fort Benjamin Harrison: Brain and Spinal Cord Injuries, Drs. J. K. Berman and Robert L. Glass, March 14; Conditions Affecting Glucose Metabolism, Drs. Franklin B. Peck and C. L. Rudesill, March 28.

Wakeman General Hospital, Camp Atterbury: Plexus and Peripheral Nerve Injuries, Capt. Irving J. Spiegel, March 14; Diseases of the Intestinal Tract, Medical and Surgical Diagnosis and Care, Drs. William Foster Montgomery and Rollin H. Moser, March 28.

Ohio

A. A. F. Regional Station Hospital, Patterson Field, Fairfield, Ohio: The Diagnosis and Treatment of the Common Arthritides, Dr. Russell Haden, March 21.

Crile General Hospital, Cleveland: Problems in the Diagnosis and Management of Coronary Artery Disease, Dr. R. W. Scott, March 27.

Virginia

Woodrow Wilson General Hospital, Staunton: Infectious Hepatitis, Col. Marian H. Baker, March 14; Relation of Dental Focal Infection to Disease, Lieut. George L. Vandewall, March 28.

Wisconsin

Station Hospital, Camp McCoy: Head and Spine Injuries, Dr. Theodore C. Erickson, March 14; Allergic States, Dr. Theodore L. Squier, March 28.

Station Hospital, Truax Field: Arthritis, Dr. Milton C. Borman, March 14; Peripheral Vascular Diseases, Dr. Geza de Takats, March 28.

HOSPITALS NEEDING INTERNS
AND RESIDENTS

The following hospitals have indicated to the Council on Medical Education and Hospitals that they have not completed their house staff quota allotted by the Procurement and Assignment Service:

(Continuation of list in *THE JOURNAL*, February 24, page 467)

COLORADO

St. Anthony Hospital, Denver. Capacity, 230; admissions, 6,602. Sister M. Mechtildis, R.N., Superintendent (2 interns).

GEORGIA

Emory University Hospital, Emory University. Capacity, 267; admissions, 8,064. Dr. R. M. Paty Jr., Medical Director (resident—medicine, July 1, disqualified for military service).

ILLINOIS

St. Elizabeth Hospital, Chicago. Capacity, 342; admissions, 8,180. Sister M. Vetusa, R.N., Superintendent (interns). Women and Children's Hospital, Chicago. Capacity, 155; admissions, 3,538. Mrs. Edna Nelson, R.N., Superintendent (woman intern, now).

INDIANA

St. Catherine Hospital, East Chicago. Capacity, 324; admissions, 6,894. Sister M. Cordula, R.N., Superior (3 interns, July 1).

NEBRASKA

St. Elizabeth Hospital, Lincoln. Capacity, 230; admissions, 6,433. Dr. Arthur L. Smith, Medical Director (interns).

NEW YORK

Linen Hospital, New York. Capacity, 469; admissions, 9,516. Dr. Herman E. Bauer, Medical Superintendent (4 interns, July 1).

OHIO

Jewish Hospital, Cincinnati. Capacity, 309; admissions, 7,996. Mr. Van C. Adams, Superintendent (resident—surgery, July 1, disqualified for military service).

Lakewood Hospital, Lakewood. Capacity, 157; admissions, 4,276. Dr. R. B. Crawford, Superintendent (interns).

St. Rita's Hospital, Lima. Capacity, 185; admissions, 5,640. Sister Mary Aquin, R.N., Superintendent (intern, July 1).

Riverside Hospital, Toledo. Capacity, 128; admissions, 4,286. Mr. Norman L. Losh, Director (2 interns, 1 resident, disqualified for military service).

ORGANIZATION SECTION

DEFERMENT OF MEDICAL AND PREMEDICAL STUDENTS

The following bill, S 637, was introduced February 26 in the Senate of the United States by Mr. Ellender and referred to the Committee on Military Affairs

A Bill

To authorize the release of persons from active military service, and the deferment of persons from military service, in order to aid in making possible the education and training of physicians and dentists to meet essential needs

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That, to the extent that the President deems to be (1) feasible, (2) compatible with military operations, and (3) necessary or desirable in order to make possible the education and training as physicians and dentists of as many persons as are necessary to provide the minimum number of medical doctors and dentists required to meet the essential needs of the civilian population (especially in rural areas) and the armed forces for medical and dental services in the future the President is authorized to provide for the release from active duty in the armed forces of men who have completed more than one year of honorable service in such forces during the present war and who have satisfactorily completed a substantial portion of the medical, dental, premedical or predental education and training necessary to qualify them as physicians or dentists, in order to enable such persons to pursue further such education and training. The release of any person from active duty for the purposes of this section may be conditioned upon his acceptance by an accredited school and the pursuit of such education and training in a satisfactory manner

Sec 2 Section 5 of the Selective Training and Service Act of 1940, as amended, is hereby amended by adding at the end thereof the following new subsection

"(n) In order to make possible the education and training as physicians or dentists of as many persons as are necessary to provide the minimum number of medical doctors and dentists required to meet the essential needs of the civilian population (especially in rural areas) and the armed forces for medical or dental services in the future, the President shall under such rules and regulations as he may prescribe, provide for the deferment from training and service under this act in the land and naval forces of the United States of those men who are found in accordance with section 10 (a) (2) to be enrolled in the national medical and dental education program. The President shall provide for the enrollment, under such rules and regulations as he may prescribe, in a national medical and dental education program (hereinafter referred to as the 'program') of such persons as he deems necessary to be enrolled in such program in order that they may be deferred under this subsection from training and service under this act, subject to the following limitations

"(1) (A) The number of men enrolled in the program for the purpose of permitting them to pursue first year premedical education and training shall not exceed eight thousand at any one time

"(B) The number of men enrolled in the program for the purpose of permitting them to pursue first year predental education and training shall not exceed three thousand and five hundred at any one time

"(2) (A) The number of men enrolled in the program for the purpose of permitting them to pursue second year premedical education and training shall not exceed eight thousand at any one time prior to the end of the third month of the academic

year and shall not exceed four thousand five hundred at any one time after the end of the third month of the academic year, and after the end of such third month shall not include any one who has not been accepted for admission to the earliest subsequent entering class of an accredited medical school following the satisfactory completion of such second year premedical education and training

"(B) The number of men enrolled in the program for the purpose of permitting them to pursue second year predental education and training shall not exceed three thousand five hundred at any one time prior to the end of the third month of the academic year and shall not exceed one thousand seven hundred and fifty at any one time after the end of the third month of the academic year, and after the end of such third month shall not include any one who has not been accepted for admission to the earliest subsequent entering class of an accredited dental school following the satisfactory completion of such second year predental education and training

"(3) No man shall be enrolled in the program for the purpose of permitting him to pursue premedical or predental education and training for more than two years

"(4) (A) The number of men enrolled in the program for the purpose of permitting them to pursue first year, second year, third year or fourth year medical education and training shall not exceed four thousand five hundred in each of such classes at any one time

"(B) The number of men enrolled in the program for the purpose of permitting them to pursue first year, second year, third year or fourth year dental education and training shall not exceed one thousand seven hundred and fifty in each of such classes at any one time"

In determining the number of men who may be enrolled in the program, the President shall take into consideration and make due allowances for the number of physicians or dentists who may be obtained through the education and training of other persons not enrolled in the program, including veterans of the armed forces, women and persons not qualified for military service. The limitation on the number of men who may be enrolled in the program shall not be deemed to be a limitation on the total number of students who may be enrolled in medical, dental, premedical or predental schools but shall be deemed to be a limitation only on the number of men who may be deferred under this subsection who shall be in addition to students who may be obtained from other sources. Persons shall not be enrolled in the program for the purpose of permitting them to pursue medical or dental education and training at any schools except medical and dental schools whose graduates are acceptable to the armed forces for commissioning as medical doctors or dentists. The number of men who may be enrolled in the program for the purpose of permitting them to pursue each of the two respective years of premedical or predental education and training shall be allocated by the President among the several states on the basis of population as determined by the 1940 census. The men to be enrolled in the program from each state for the purpose of permitting them to pursue such education and training shall be selected from among applicants within such state, in such manner as the President may prescribe. In making such selections, representatives of accredited schools which offer full time medical, dental, premedical or predental courses of instruction shall be consulted and their services may be utilized. No man who fails to make satisfactory progress in pursuing his education and training shall be permitted to continue to be enrolled in the program

Council on Medical Service and Public Relations

THE ATLANTA CONFERENCE

Senator Claude Pepper of Florida was the guest and principal speaker at the fourth regional conference of the Council on Medical Service and Public Relations, which was held at Atlanta, Ga., February 23. Representatives from Alabama, Georgia, Mississippi, North Carolina, South Carolina and Tennessee attended the conference. The delegates from Florida and Louisiana were unable to be present.

Senator Pepper, who was in Atlanta attending another meeting but took time to address the conference, was introduced by Dr. James E. Paullin, Past President of the American Medical Association and a member of the Council. "I have explained to Senator Pepper that this is a conference composed of men who are extremely interested in the problems of health and medical care and that we greatly appreciate having Senator Pepper, who is likewise interested in these problems, as our guest" Dr. Paullin said as conference chairman.

Senator Pepper's Remarks

Our committee was authorized by a senate resolution to constitute itself as a Subcommittee on Education and Labor. Not only was the committee recently reconstituted by a Senate resolution but Senator Murray, chairman of the full committee in which all health matters appear, set up a subcommittee to work on all problems pertaining to health. I recommended to Senator Murray that we enlarge our special committee to include nine altogether. The one first set up consisted of Democrats Thomas of Utah, Tunnell of Delaware and myself as chairman. The other members are Republican Wherry of Nebraska and a Progressive, La Follette of Wisconsin. Recently Senator Wherry requested to be permitted to resign from the committee. Replacing him was Republican Smith of New Jersey. I recommended to Senator Murray that he add four more senators. Now he appointed himself, Senator Murray of Montana and Senator Hill of Alabama, co-author of the hospital bill sponsored by the Hospital Association, hearings on which are to begin next Monday. Then two Republicans were added, Senator Taft of Ohio and Senator Aiken of Vermont. The committee now consists of Five Democrats, three Republicans and one Progressive, La Follette of Wisconsin. I recommended to Senator Murray that he appoint the same Senators as were on the special Senate committee, which has a small amount of funds and power to carry on investigations, and that the same be named a permanent Senate committee. We have recently obtained from Senator George permission to enlarge our inquiry and let this committee cover the field of the health of veterans and health facilities rendered by veterans. Senator George, of course reserving the right to legislate on his Committee on Finance, gave us permission to go ahead with our study and to publish the report which we have already prepared. This will be published on February 26 as an inquiry into the health of veterans. When I started into this subject, some thought it was an effort on the part of Pepper of Florida to inflict socialized medicine on the country. I reiterate that I have never favored socialized medicine. I live in the field of politics and am not angry with any of my doctor friends who misinterpreted my views. I have no desire to impair the integrity of the profession or the right of the patient to make a free choice of doctor, dentist or nurse or anything else we think of as Americanism. I think we are making real progress in this field. I am very happy to say that when our report was published the first person to contact me was Dr. Fishbein. He wrote me a letter commending the report, published it in full in *THE JOURNAL* and wrote an editorial complimenting the work and the report. From all over the country, if I may say so, we have had generous and considerate comments. The other night in New York we had a discussion of public health and we had a forum on the New York Times. Michael Davis, Kingsley Roberts, Kaempfert, Fishbein and I discussed the subject. Before that time Dr. Fishbein and I had luncheon. A few days ago Dr. A. W. Richards, whom you will know as a member of

the Committee on Medical Research of the National Research Council, and Dr. Palmer from New York, working on a report under Dr. Richards, were in contact with me. Whenever I could I have urged representatives of medical associations to be present. We have pleasant contact with foundations interested in research, and many individuals like Mr. Albert Lasker and others have been working with us. I believe it is not unfair to say that for the first time we have a Congressional committee which is in a position to be a coordinating committee, and we should get something constructive from it.

Dr. Vannevar Bush is making a study under the direction of the President on the question of continuation of publicly financed medical research. The President has said that as soon as the report is ready it will be made available to us and other Congressional groups interested in it. Dr. Fishbein and Dr. Lewis Weed the other day agreed that there was no reason why we could not all get together in agreement as to where funds will be given out. Drs. Palmer, Richards and others are trying to work out something that the President will consider; some sort of agency properly constituted, a certain number of doctors, professors, foundation people, public men and chemists; at least some sort of an agency to allocate a sizable amount of public money to the encouragement of medical research wherever such encouragement may be given. We don't want to load the committee down with research not properly related to medical research. It should be concerned only with those things scientifically and directly connected with public health. There is no reason why even in the next few weeks, certainly the next few months, we may not be able to get together the profession, various agencies and the President on a medical research program, or at least on personnel who will aid a program or with the provision of money to give aid to such a program.

The Committee on Education and Labor, of which I am a member, will start hearings on the Hill-Burton bill for the construction of a national system of hospital facilities. Generally speaking, it follows the plan proposed by Surgeon General Parran and evolving over the past several years, namely to have what might be called a health center in rural areas, rural hospitals, of course more complete than health centers, district hospitals and then a base hospital, not only a hospital but a teaching place as well. My subcommittee will take the bill as soon as the hearings are finished and study it and make such amendments as we think proper. We may recommend additional hearings and extend it a few days.

The next great field is the provision of additional medical (including dental) personnel. I think we are agreed that we should give adequate dental service to the people. Dental service is now available to 30 per cent. It should be given to 90 or 95 per cent. That will take more dentists. It will give more honorable occupation to men and boys and girls in the country. More technical schools are needed, and the rendition of more services may be the solution of employment of people. If we give people in the country the medical care which they should have the number of the profession will be too small. At least we may give a doctor enough leisure to do as he wishes and also make it possible to restrict his activity as he grows older to what he wants to do. We have in our report recommended that there should be scholarships or loans for people qualified to get medical education. We are not trying to lower medical standards; we are trying to raise them. I am a person of vocational training; others should be. We worked in power plants, waited on tables and the like and borrowed money from the loan foundation. I would not be grateful if I did not try to open the doors of opportunity to more who have aptitudes and who would render service. We don't want to flood the medical profession with too many doctors. If any one wants to establish an overall figure which we should not exceed I would not want to go beyond that. I do think we can aid boys and girls who have aptitudes for the profession to get into the profession by scholarships and loan funds. Women should be admitted to professions on equality with men. There is a difference of opinion on this. I think it is a part of our evolutionary concept that women should enter medicine as well as men. But when you get ample hospital facilities, when you get all the doctors, dentists and nurses you need, we must still make the facilities and services available to the American people in a correct way.

That is the problem. And we must do this without lowering standards of the profession. We want to raise the standard, not lower it.

We have the Wagner-Murray-Dingell bill, and that bill contemplates compulsory insurance. It would undoubtedly cover many people and bring them into an insurance scheme and provide vast quantities of funds not now available for these facilities. That is compulsory in character. I am not quarreling with the profession that seems to be against the bill. They feel that the ill of it will exceed the good and we want a directive from this point. Only a few claim that the present system is adequate for every one. My problem is to find the answer between the present systems. There is the feeling that we are to bring conflicting opinions together.

I started off with the idea that first I want to preserve the system of voluntary membership and payment. If you are going to make the program voluntary in character and if it is going to be available to a great amount of persons, payment must be low. Twenty-one per cent of all the American people, of families in the United States, have an annual income of less than \$1,000 per family. Twenty-nine per cent of all the families in 1942 had an annual income between one and two thousand dollars. Twenty per cent of all our families had an income between two and three thousand dollars, 20 per cent between three and five thousand dollars, 10 per cent in excess of five thousand dollars. Only 10 per cent have incomes in excess of five thousand dollars. Every one here has more than ten thousand dollars. We all realize how hard it is to get along with our incomes and live according to a decent way of living. You are practicing medicine for a livelihood. I don't think it is put on the doctor to give away his services. I think that if there is going to be a donation, groceries and legal aid should be given too. If you do anything other than that you are bound to charge some one else more or lose out.

I have been thinking in terms of building the hospitals through a plan sponsored by the hospital associations and councils. When we get enough hospitals and doctors I think it should be a plan of insurance to which membership is open on a voluntary basis, each member paying either a fixed amount or a graduated amount according to income. It might be determined by income taxes paid, in order to have some standard. We might have everybody pay a certain amount of money to justify having the same system for the rich and poor alike. The difference between the total receipts of the plan and the total cost of operating the plan would be made up by federal and state subsidies. The disparity in the long run would not be as great as the first way. It is more consistent with our idea that there should be equality between what a man pays and what he can pay. A man paying an income tax on less than \$500 would pay 50 cents a month for each member of his family and himself. A man paying taxes on an annual income as much as one thousand dollars would pay a dollar a month. Next scale on up. We might get on up to where a well to do man would perhaps pay ten dollars a month per person. He might prefer to do it that way rather than go to his own doctor or private hospital. It still preserves the patient's choice of hospital, doctor, nurse to a considerable degree by giving a rich man the right to go to his own doctor and let that doctor turn in his bill to the association. If the association and doctor want to work out a reasonable plan he might charge a little less than he would ordinarily charge. I don't know. I am just thinking out loud. I am thinking of a statewide association operated under the supervision of a statewide council created by a state legislature and appointed by the governor properly constituted. I had in mind the statewide plan, because if you set up a little association down here in the county, sparsely populated, the doctors won't go there and practice. It would be a losing organization. My concept is to make the state the basis. I would like an effective state council with a federal council aiding to work out the necessary arrangements.

What we contemplate is cooperation between state councils and federal councils by which the states are constantly experimenting in this field, working out new techniques and always having a certain amount of latitude, maybe constantly recommending to the federal council plans and programs to be worked out and getting federal aid. If you had the state as a basis in setting up insurance schemes, deficiencies between income and

disbursement (provision of physical facilities) not part of outlet but just operation costs would be made up by subsidies. You can't do it all at one time. You can't start any of the construction before the end of the war. I don't know what the amount should be. I don't know how it should be graduated. I don't know how to integrate the plan to include Blue Cross schemes and private insurance schemes which insure their workers. I do know that a plan that includes only the worker and not his family is not a good plan.

There must be correlation between civilian and veterans' plans. The veterans' plan has already authorized five hundred million dollars for construction of hospitals. Many believe that the Veterans Administration has not been able to give the best medical service to the veterans. Perhaps not the best doctors have come in, maybe for other reasons. A lot of persons think the Veterans Administration has not given the maximum quality to the veterans. The veterans have generally rested all of their program under one head and treated all their men in veterans' hospitals. But it is a local problem. Many individual men will have to leave their families and go a long ways to get into hospitals. We have committed ourselves to let every veteran go to veterans' hospitals not only for service connected disabilities but for all other services necessary where not able to procure it elsewhere. For all practical purposes the United States government has underwritten medical service and hospital facilities for every American veteran. This will mean before we get through probably fifteen million persons. We got into it because we saw the necessary overlapping of medical and hospital program with the veterans' program. We began to wonder about the economy to set up a program for veterans detached from civilian personnel. We have suggested in our tentative report to be out on the 26th that the Veterans Administration consider aiding us in the provision of adequate hospital and medical service in civilian population rather than only for veterans. I am inclined to think there is something in this.

We are entering on a period when the public and the veterans are going to demand from us all hospitals, doctors, dental and nursing facilities and services. In the next few weeks we are actually going to put something down on paper. The staff is to have a study of every plan they know of in the next few days. The Blue Cross plans have done splendid work in the field and are getting down to a complete coverage program. Parran and I had lunch together; he pointed out that he was not quite sure if we should approach the people telling them more or less what we have done, such as in tuberculosis, venereal disease program, hospital program, nursing program, in the hope that we might have covered a part of it and should shoot at something comprehensive in character. I wanted to acquaint you with a little of what we are doing and the point of view from which we are approaching it. We have a committee made up of all types and Democrats and Republicans, Liberals and Conservatives. We work through all agencies to accomplish something we shall all be proud of as a contribution to public health.

General Discussion

The program for the morning session of the conference was composed of talks and discussions led by representatives of the various departments and bureaus of the American Medical Association. The speakers were Mr. J. W. Holloway Jr., director of the Bureau of Legal Medicine and Legislation, Dr. J. S. Lawrence, director of the Washington Office of the Council, and Lieut. Col. Harold C. Luth, liaison officer. Dr. Victor Johnson, Secretary of the Council on Medical Education and Hospitals, talked on the problems confronting the medical profession as found by the Council. Dr. Johnson said "The war has interjected a great many difficulties into our entire system of medical education, commencing with the college and premedical course and going through the many stages including the advanced residents' training. There are serious problems introduced at every point. . . . It is gratifying that hospitals are planning very carefully through committees which are working at the problem of providing additional training for the physicians returning from the war. Considerable expansion of residencies and fellowships is under way in approved hospitals. Large key hospitals are integrating their programs with other institutions. Interhospital cooperation has been very gratifying to us."

Medical Legislation

DISTRICT OF COLUMBIA

Bill Introduced.—H. R. 2424, introduced by Representative McMillan of South Carolina, proposes to establish in the Health Department of the government of the District of Columbia the position of Assistant Health Officer in Charge of Tuberculosis and to impose on him the duty to formulate and coordinate general policies relating to tuberculosis control, to appoint and fix the compensation of a supervisor of tuberculosis clinics, to allocate, with respect to race and sex, all tuberculosis beds maintained by the District of Columbia, to act as liaison officer between the Health Officer and various units dealing with tuberculosis control, and to review all estimates of appropriations for activities coming under his jurisdiction prior to the submission of such estimates to the Bureau of the Budget.

MEDICAL BILLS IN CONGRESS

Change in Status.—The House Committee on Ways and Means has ordered favorably reported H. R. 2348, to bring within the purview of the federal narcotic laws "any drug (as defined in the Federal Food, Drug and Cosmetic Act) found by the Secretary of the Treasury, after due notice and opportunity for public hearing, to have an addiction-forming or addiction-sustaining liability similar to morphine or cocaine, and declared by the Secretary to have been so found."

Bills Introduced.—S. 619, introduced by Senator George, Georgia, for himself and Senator Thomas, Utah, Senator Hill, Alabama, Senator LaFollette, Wisconsin, Senator Aiken, Vermont, and Senator Ellender, Louisiana, provides for vocational education and retraining, including part-time training and work-experience programs for the occupational adjustment and readjustment of youth and adults, including persons demobilized from essential war work or from the armed services. S. 652, introduced by Senator Maybank, South Carolina, and H. R. 2447, introduced by Representative Richards, South Carolina, provide for the issuance of death certificates in case of persons dying in the military or naval forces. S. 637, introduced by Senator Ellender, Louisiana, proposes to authorize the release of persons from active military service, and the deferment of persons from military service, in order to aid in making possible the education and training of physicians and dentists to meet essential needs. H. R. 2346, introduced by Representative Peterson, Florida, provides aid in the readjustment in civilian life of those persons who rendered war service in the United States merchant marine during World War II and to provide aid for the families of deceased war-service merchant seamen. This bill proposes to confer on war-service merchant seamen the benefits contemplated by the G. I. Bill of Rights and in addition, among other things, provides that any such seamen shall be entitled to medical, surgical and dental treatment and hospitalization without charge at hospitals and other stations of the Public Health Service if he is (1) in need of care and treatment for a disability with respect to which the disability endorsement on his certificate of maritime war service was made or (2) unable to defray the expenses of necessary care and treatment. The bill, too, authorizes the furnishing of medical advice and outpatient treatment by the United States Public Health Service to dependent members of the family of a disabled or deceased war-service seaman at such per diem cost as may be prescribed from time to time by the President for the hospitalization of dependents of Naval and Marine Corps personnel at any naval hospital. H. R. 2403, introduced by Representative Curtis, Nebraska, proposes to impose an occupational excise tax on certain dealers in peyote, to impose a transfer tax on certain dealings in peyote and to safeguard the revenue therefrom by registry and recording. The term "peyote" is defined to mean "all parts, including the seeds, of the plant *Lophophora williamsii* (Lem.) Coulter, and the plant *Lophophora lewinnii* Thompson, whether growing or not; any alkaloid extracted from any such part; and any compound, manufacture,

salt, derivative, mixture or preparation of any such part or alkaloid." H. R. 2417, introduced by Representative Gathings, Arkansas, proposes to authorize the completion by the use of Lanham Act funds of hospital projects initiated by the Works Progress Administration and the Work Projects Administration. H. R. 2422, introduced by Representative Lynch, New York, proposes to provide for a system of old age and survivors' insurance for employees of religious, charitable, educational and certain other organizations. H. R. 2449, introduced by Representative Peterson, Florida, provides that any person who served in the United States merchant marine between April 6, 1917 and July 2, 1921 and who received a certificate of honorable discharge from the Sea Training Bureau of the United States Shipping Board shall be entitled to medical, surgical and dental treatment without charge at hospitals and other stations of the Public Health Service and may receive such care and treatment at the expense of the Public Health Service from public or private medical or hospital facilities other than those of the service when authorized by the officer in charge of the hospital or station of the Public Health Service at which application for care and treatment is made.

STATE LEGISLATION

Arizona

Bill Introduced.—H. 167, to amend the naturopathic practice act, proposes to extend the scope of a license to practice naturopathy by permitting the holder thereof to use biochemistry, pharmacotherapy, minor surgery and phytotherapy.

Arkansas

Bill Introduced.—S. 271 proposes to create a state cancer commission to be composed of the governor, the chairman of the Committee on Cancer Control of the Arkansas Medical Society and three other persons to be appointed by the governor, two of whom shall be members of the Arkansas Medical Society and the third member not to be a physician. The commission is to conduct such cancer clinics in such places as it deems proper and engage in a program of cancer education.

Connecticut

Bill Introduced.—H. 317 proposes that the law prohibiting the prescribing and use of contraceptives shall not be construed to prevent a licensed physician from prescribing a contraceptive when in the opinion of the physician pregnancy would endanger the life or health of the woman.

Illinois

Bill Introduced.—H. 163, to amend the narcotic drug act, proposes so to define narcotic drugs as to include isonipecaine.

Indiana

Bill Introduced.—H. 129 proposes to make any physician eligible to be selected and to serve as a member of the governing board of any hospital supported in whole or in part by public funds on the same terms and conditions as pertain to any other person to be selected for such service.

Iowa

Bill Introduced.—H. 319 proposes to require a hospital in which a child is born to take immediately after birth prints of each foot and to furnish copies thereof to the department of public safety. If a child is born elsewhere it is to be the duty of the attending physician, midwife or person in charge to notify the department of the birth and to execute such forms as may be required by the department. The department in such circumstances apparently is to cause prints of the feet to be taken.

Kansas

Bills Introduced.—S. 211 and H. 220 propose to authorize cities of the second class having a population of from 5,000 to 8,000 and located in a county having a population of from 11,000 to 14,000 to issue bonds up to \$375,000 to build and equip a

hospital. S. 248 and H. 267 propose to prohibit the operation of a hospital, sanatorium, rest home, nursing home or a related institution unless licensed by the state board of health. H. 218 proposes to enact a separate naturopathic practice act and to create an independent board of naturopathic examiners. The bill proposes to define naturopathy as "the art, science and philosophy of natural healing as taught in recognized schools or colleges or schools of natural healing but shall not include the practice of medicine, surgery, osteopathy, chiropractic or Christian science."

Maine

Bill Introduced.—S. 216 proposes to require a physician attending a pregnant woman to take or cause to be taken a sample of her blood and to submit that sample for a standard serologic test for syphilis to an approved laboratory. The present law requires the physician to do this only if the woman consents.

Maryland

Bill Introduced.—S. 416 proposes to repeal the present statutory provisions relating to the practice of osteopathy and to enact in their stead an entirely new osteopathic practice act under the terms of which osteopaths would be authorized "to practice osteopathy in all its branches, which shall include the right to practice operative surgery with instruments and obstetrics, to administer anesthetics, antiseptics, narcotics and biologics, to sign birth, health and death certificates, and to perform such diagnostic and therapeutic procedures as are taught and practiced in the legally incorporated colleges of osteopathy of good repute." The present law specifically states that the license granted an osteopath authorizes him to practice by manipulation only.

Massachusetts

Bill Introduced.—S. 491 proposes to require the state to furnish medical care to recipients of old age assistance. Such recipient is entitled to the services of a physician of his own choice.

Michigan

Bill Introduced.—H. 182 proposes to prohibit the operation of a hospital, sanatorium, rest home, nursing home, infirmary or other similar institution without a license from the state department of health.

Minnesota

Bills Introduced.—S. 370 and H. 458 propose so to amend the narcotic drug act as to define the term "narcotic drugs" to include isonipecaine. S. 669 proposes to authorize the organization and operation of nonprofit medical care corporations to provide nonprofit medical care plans under which medical care is provided at the expense of the corporation to subscribers to the plan.

Nevada

Bills Introduced.—A. 62 proposes to prohibit the operation of a maternity hospital or maternity home unless licensed by the state board of health. A. 117, to amend the chiropractic practice act, proposes to define chiropractic "to mean the practice of chiropractic as taught in Chiropractic schools or colleges; and also the use of all necessary electrical, mechanical and hygienic and sanitary measures incident to the care of the body, including the science of palpating and adjusting the articulations of the human spinal column by hand."

New York

Bills Introduced.—S. 1028 proposes to prohibit scientific experiments or investigations on a living dog. S. 1130 proposes to make it the duty of the appropriate medical inspector to examine each public school pupil for symptoms of tuberculosis at least once a year.

New Mexico

Bills Introduced.—H. 195, to amend the medical practice act, proposes to require all licentiates of the board of medical examiners to register annually in November with the board and at that time to pay an annual registration fee of \$2. H. 251 proposes to prohibit the employment in a public or private

school of any person who has any communicable disease in a transmissible form. All applicants for any such position must submit a certificate from a licensed doctor of medicine that the applicant is free from any such disease. Such a certificate is to be required annually thereafter of employees.

North Carolina

Bill Introduced.—S. 178 proposes to authorize the establishment and operation of the North Carolina Hospital for Treatment of Spastic Children.

Ohio

Bill Introduced.—S. 90 proposes to require every physician attending a woman for conditions relating to pregnancy to take or cause to be taken a sample of her blood at the time of the first examination or within ten days thereafter and to submit that sample to an approved laboratory for a standard serologic test for syphilis.

Oregon

Bills Introduced.—S. 203 proposes so to amend the narcotic drug act as to define "narcotic drugs" to include isonipecaine. H. 367 proposes to require the state board of health to survey the location, size and character of existing hospitals and health centers and to evaluate the sufficiency of those existing facilities to supply the necessary physical facilities for furnishing adequate service. H. 372 proposes to make it unlawful to manufacture, sell or possess for the purpose of sale any live organism vaccine or any viable animal disease control vaccine without possessing an appropriate license from the department of agriculture.

Pennsylvania

Bills Introduced.—S. 307 proposes to prohibit the performance of an operation in a hospital or other place in which operations are performed without first requiring a preoperative study and diagnosis to be had and a record thereof to be made. The provisions of the bill, however, are not to apply to an emergency operation or oral surgery. The preoperative study referred to in the bill is to include a complete history of the case and the report of a thorough physical examination including examinations of the heart, blood vessels, blood, lungs and urine. H. 416 proposes to require that on or before the third anniversary of the termination of present hostilities every hospital be equipped with electric light fire warning systems. H. 474 proposes to authorize any state agency examining and licensing applicants for licenses to practice a profession or vocation to grant such a license without examination to a discharged member of the military or naval forces of the United States. H. 638 proposes to authorize the sexual sterilization of certain socially inadequate inmates of state institutions.

Tennessee

Bills Introduced.—S. 525 and H. 712 propose to authorize the establishment of a nonprofit hospital corporation to operate nonprofit hospital service plans.

Texas

Bill Introduced.—H. 438 proposes to prohibit the retail sale or other distribution of barbital except on the written prescription of a licensed physician, dentist or veterinarian.

Utah

Bills Introduced.—S. 202 proposes to authorize cities and towns to operate hospitals and to join with other cities, towns and counties in the construction and operation of such hospitals. S. 234 proposes to designate the state department of health as the state agency to receive funds which may be made available from federal agencies for the prevention and control of communicable diseases and for surveying, planning, constructing and operating hospitals, public health centers and related facilities. H. 213 proposes that any person ill with tuberculosis who neglects to obey the instructions of the state or local health board or officer in matters relating to the protection of others against the disease shall be placed under quarantine. H. 234 proposes to require of a food handler an annual medical examination for tuberculosis, venereal disease or any communicable or enteric disease.

Donald, past president of the Wayne County Medical Society and one of the founders of the lectureship foundation committee, at the society headquarters, 4421 Woodward Avenue, Detroit 1.

James Bechtel Resigns.—Mr. James Bechtel, who has been executive secretary of the Wayne County Medical Society since 1935, has resigned, effective February 1. Miss Else Kolhede, formerly in charge of offices of the county society, has been named to succeed him. Mr. Bechtel will be associated with Mr. Jerry Totzka, formerly Michigan director of drugs and drug stores, in the Drug Industries Company of Detroit. The principal product at the present time of the Drug Industries Company is a line of prescription vitamins available to the public only on the prescription of a physician, it is reported.

Lectures on Chemotherapy.—The department of chemistry in the college of liberal arts, Wayne University, Detroit, opened a series of lectures on chemotherapy February 13 with a discussion by Herbert E. Carter, Ph.D., Urbana, Ill., on "Some Biochemical Aspects of Antibiotic Substances." Frederick F. Blicke, Ph.D., Ann Arbor, discussed "Synthetic Antispasmodics" February 20. Others in the series included:

William H. Feldman, D.V.M., Rochester, Minn., Chemotherapy in Experimental Tuberculosis, February 27.

Clarence K. Banks, Ph.D., Detroit, Organometallic Compounds, March 6.

Harry S. Mosher, Ph.D., State College, Pa., Synthetic Antimalarial Drugs, March 13.

Elmore H. Northey, Ph.D., Bound Brook, N. J., Sulfonamide Chemotherapy: Facts and Fancies, March 20.

Willard H. Wright, Ph.D., Bethesda, Md., Past Developments and Present Needs in the Chemotherapy of Parasitic Diseases, March 27.

MINNESOTA

State Inaugurates Accreditation of Schools in Tuberculosis Program.—A program has been launched in Minnesota whereby individual schools or entire school systems are to be certified under a plan developed by the American School Health Association. The subcommittee for Minnesota, consisting of Dr. Edward A. Meyerding, St. Paul, executive secretary, Minnesota Public Health Association, Dr. Sidney A. Slater, medical director of the Southwestern Minnesota Sanatorium, Worthington, and Dr. Lewis S. Jordan, medical director of Riverside Sanatorium, Granite Falls, has drawn several classifications to provide for schools doing different degrees of tuberculosis work, the class A certificate, the highest classification, going to the ideal program, which would detect all tuberculosis in any stage of its development and would provide for the creation of an environment entirely free from the disease. Under the program a tuberculosis control award will be given by the American School Health Association certifying that the recipient has fulfilled the minimum requirements set up by the association for the control of tuberculosis. Because the standards for certification would necessarily differ in the various states, depending on such factors as the incidence of infection, it was considered best to have the subcommittee of the school health association in each state decide on the standards for its own state. Dr. Jay A. Myers, Minneapolis, is credited with being the originator of the plan.

MISSISSIPPI

Public Health Election.—Dr. Archie L. Gray, Jackson, was recently chosen president-elect of the Mississippi Public Health Association at its meeting in Jackson. Dr. Cyrus M. Shipp, Bay St. Louis, was installed as president. Dr. Hugh B. Cottrell, Jackson, is the secretary-treasurer of the association.

Guy Post Named to New Position.—Dr. Guy R. Post, Clarksdale, director of the Coahoma County Health Department for six years, has accepted a position as medical director of the crippled children's service and medical consultant of vocational rehabilitation for the state of Mississippi. Newspapers reported that he was to take up his new work on February 16, with offices in the Standard Life building, Jackson.

NEW YORK

Demonstration Area Chosen for Rheumatic Fever.—In a recent talk Dr. John Fred Hiss, professor of clinical medicine, Syracuse University College of Medicine, announced the organization of a demonstration area for the treatment of rheumatic fever for New York State to be set up in the four counties of Onondaga, Cayuga, Cortland and Oswego. The purpose of the program, which will be extended to the rest of the state when successfully organized in these four counties, is to provide a complete plan for combating rheumatic fever. The proposed plan will be known as the Syracuse District Cardiac Program. In explaining the need for such a program

Dr. David D. Rutstein, Albany, deputy commissioner of health of New York City, enumerated as reasons the difficulty of diagnosis, the chronic nature of the disease, the wide prevalence of the disease and the complexity of care necessary for patients. In discussing the problem Dr. Homer F. Swift of the Rockefeller Institute for Medical Research said that in New York City in 1938 five times as many deaths were caused among children by rheumatic fever as by whooping cough, spinal meningitis, measles, diphtheria and scarlet fever combined. Other speakers on the program at which the new project was announced included Drs. Albert D. Kaiser, Rochester, and T. Duckett Jones, Boston.

Seek Fund to Finance Distribution of Blood.—On February 16 the legislature was asked to appropriate \$100,000 for use by the state commissioner of health in establishing a program for the collection and distribution of human blood and its derivatives for the treatment of the sick and injured in the state, the *New York Times* reported. The idea stemmed from a suggestion made to the health department two years ago by the state medical society and was presented in a bill by Assemblyman Lee B. Mailler, chairman of the New York State Health Preparedness Commission. The state department after a two year study formed the following conclusions:

That the current use of blood and blood derivatives in hospitals and medical practice in the state to date is only 60 per cent of that estimated to be the desired use on the basis of current knowledge of the value of these products.

That more than 90 per cent of the hospitals in the state are not in a position to carry out adequate testing for blood types with regard to the Rh factor, largely because of the scarcity and cost of the so-called potent Rh typing serum.

That for the money now being spent in this field the state could supply to communities all the blood and plasma needed as well as a large variety of useful derivatives and special products, such as Rh typing serum and antipertussis or anti-whooping cough serum which are not now available.

It was stated that the present use of blood and its derivatives was confined to the larger urban centers. If approved, it is anticipated that the program during its first year would not be complete but would make blood products widely available and would supply important additional derivatives.

New York City

The Harvey Lecture.—Dr. Edwin B. Astwood, assistant professor of pharmacotherapy, Harvard Medical School, Boston, will deliver the sixth Harvey Society Lecture of the current series at the New York Academy of Medicine, March 15. His subject will be "Chemotherapy of Hyperthyroidism."

Orthopedic Rehabilitation.—Dr. Vasili D. Chakhlin, director of the Moscow Orthopedic and Prosthetic Institute, and Dr. Philip D. Wilson addressed the New York County chapter of the American-Soviet Medical Society, February 28 on "Reconstruction by Orthopedic Treatment." The film "Soviet Medicine at the Front" was also shown at the meeting.

Free Chest X-Rays for Students.—Beginning February 26 all pupils in the third and seventh terms of the New York City Vocational High Schools will be offered free tests and, when necessary, free chest x-rays to determine that their lungs are in good condition. Both tests and x-rays will be given in the school buildings under the joint supervision of the city department of health and the board of education. Pupils must obtain the written consent of a parent or guardian in order to qualify for this service.

New Child Center.—The building equipment at 2 East 105th Street, formerly used by the New York Society for the Prevention of Cruelty to Children, is being donated by the society to a group representing Catholic, Protestant and Jewish welfare organizations for use as a home for neglected and dependent children between the ages of 2 and 16. The new group, the Association for Temporary Care of Children, held its organization meeting in Mayor La Guardia's office recently, choosing Mrs. Helen E. Dickinson, who recently returned from India, where she served as a representative of the American Red Cross as director of the new home. The society will maintain part of the maintenance of the new project.

Columbia Merges Medical and Dental Staffs.—The dental and medical faculties of Columbia University have been merged by action of the board of trustees, according to the *New York Herald Tribune*, February 7. The dentistry staff will have "departmental autonomy" and some members will have seats on the faculty of medicine, but the curriculum will be in charge of a "committee on dental education, a majority of whose members will be chosen by the dental staff," Nicholas Murray Butler, Ph.D., president, said. The name of the School of Dental and Oral Surgery will be continued. An associate dean for dental and oral surgery will be executive officer of the university department of dental and oral

surgery. Up to now the school has been headed by Houghton Holliday, D.D.S., as associate dean. Medical and surgical staffs of the Medical Center recognize need for better dental services for ward and clinic patients, and closer coordination will be achieved with unified action and direction, it was stated. Anatomy, bacteriology and nutrition "are as much dental as they are medical subjects." The decision aims to insure active support of dental teaching and research by its "strong staff of physicians, surgeons, scientists, nurses and public health leaders" and "to emphasize the importance of dentistry itself." The report indicated that there had been considerable objection to the consolidation by members of the dental faculty.

OHIO

Dr. George J. Heuer Gives Morris Lecture.—Dr. George J. Heuer, professor of surgery, Cornell University Medical College, New York, gave the eighth Roger S. Morris Memorial Lecture at the University of Cincinnati College of Medicine, February 20 (THE JOURNAL, Sept. 16, 1944, p. 182). His subject was "The Surgical Treatment of Chronic Constrictive Pericarditis: A Postscript."

Research in Toxins and Antitoxins.—Western Reserve University School of Medicine, Cleveland, has been given \$12,600 from Wyeth, Inc., Philadelphia, pharmaceutical and biological manufacturers, to conduct studies of toxins and antitoxins in order to determine more closely the active principles of these substances. The research work will be carried on by Louis Pillemer, Ph.D., research immunologist of the university's Institute of Pathology, under the direction of Enrique E. Ecker, Ph.D., professor of immunology. An attempt will be made to isolate the active substance or substances given off, for instance, by *Clostridium tetani* which causes lockjaw, and also the active substance in the antitoxic serum which affords protection in this disease. It is hoped to purify the toxin and the antitoxin of tetanus to a high degree—up to the point of homogeneity, if possible.

Joseph Wearn Named Dean of Western Reserve.—Dr. Joseph Treloar Wearn, professor of medicine at Western Reserve University School of Medicine, Cleveland, has been appointed dean of the medical school, succeeding Dr. Torald H. Sollmann, who retired as dean on July 1, 1944. Dr. Wearn will continue as professor of medicine at the university and as director of the department of medicine at Lakeside Hospital. In 1917 Dr. Wearn graduated at the Harvard Medical School, Boston, where he was serving as associate professor of medicine when he joined Western Reserve in 1929. Dr. Wearn is also a consultant to the Surgeon General of the United States Army, consultant to research and development branch of the Office of the Quartermaster General of the U. S. Army, chief of the division of physiology, committee of medical research and chairman of the subcommittee on blood substitutes of the Office of Scientific Research and Development.

PENNSYLVANIA

Personal.—Dr. Hilding A. Bengs, North Warren, who has been associated with the Warren State Hospital since 1932, was recently appointed assistant director of the bureau of mental health, state department of welfare. Dr. Bengs was secretary of Warren County Medical Society and had served in that capacity since 1937.—Dr. Budd J. Reaser, Martins Creek, was elected president of the Northampton County Board of Prison Inspectors recently.

Diplomates Association Formed.—The Diplomates' Association of Berks County Physicians was organized January 17 under the sponsorship of the Reading Eye, Ear, Nose and Throat Society. Membership is extended automatically to diplomates of boards listed in the Directory of Medical Specialists, and the group will meet once a year jointly with the Reading Eye, Ear, Nose and Throat Society. Officers of the new group include Drs. William S. Bertollet, president, Fred B. Nugent, president-elect, and Thomas Butterworth, secretary, all of Reading. At the recent meeting Dr. Harrison F. Flippin, Philadelphia, discussed "The Clinical Use of Penicillin."

Memorial to Physician.—The improvements and expanded services at Lehigh University, Bethlehem, will be made possible by a gift of Dr. William L. Estes, president of the Medical Society of the State of Pennsylvania, as a memorial to his father, the late Dr. William L. Estes, surgeon in chief at St. Luke's Hospital. The Estes grant will be used to revamp the present elementary biology laboratory, the new facilities to be rededicated as the William Lawrence Estes Laboratory. Dr. Estes, the donor, graduated at Lehigh University in 1905 and at Johns Hopkins University School of Medicine, Baltimore, in 1909, subsequently succeeding his father as surgeon in chief at St. Luke's Hospital. His father

was lecturer in physiology and hygiene at Lehigh from 1883 to 1923, receiving the honorary degree of doctor of science there in 1934.

Philadelphia

Rockefeller Grants for Postwar Training.—The Rockefeller Foundation has given the University of Pennsylvania School of Medicine funds to provide postwar training at an advanced level for a number of young medical men of exceptional promise whose medical education has been interrupted by the war and who now are in the armed forces, it was announced February 22. The men will be selected for study and work, under distinguished teachers, in surgery, pharmacology or psychiatry, the foundation having made three grants of \$8,000 to provide the training in each of those particular fields. The training, which will begin after the men have concluded their military service, will cover a maximum of four years, and the number of recipients will depend on the extent and character of the instruction required. Those in the field of surgery will study and work under Col. Isidor S. Ravdin, M. C., who is on leave of absence from the Harrison professorship of surgery and the directorship of the Harrison Laboratory of Surgical Research at the university while he serves as commander of an army hospital in India. The men receiving training in pharmacology will be under Dr. Carl F. Schmidt, professor of pharmacology in the University of Pennsylvania School of Medicine, and those in psychiatry under Dr. Earl D. Bond, professor of psychiatry in the school of medicine and the Graduate School of Medicine and vice dean for neuropsychiatry in the latter school.

RHODE ISLAND

Seminar on Industrial Health.—A graduate seminar in industrial health opened at Brown University, Providence, February 20, with a talk by Dr. Dwight O'Hara, acting dean and professor of preventive medicine, Tufts College Medical School, Boston, on "Bases of Industrial Medical Practice." The seminar is under the auspices of the new department of medical sciences (THE JOURNAL, July 22, 1944, p. 861). Mr. J. J. Bloomfield, senior sanitary engineer, U. S. Public Health Service, spoke February 27 on "Labor Management Relationships in Industrial Health Programs," and Dr. Harvey Bartle, Philadelphia, formerly chief medical examiner and medical director, Pennsylvania Railroad, March 6, on "Industrial Health: A Specialty." Others in the series include:

Dr. John J. Wittmer, personnel and medical director, Consolidated Edison Company, New York, Absenteeism in Industry, March 13.
Dr. Clarence O. Sappington, editor, Industrial Medicine, Chicago, What Medicine Has to Offer Industry, March 20.
Louis Schwartz, medical director, U. S. Public Health Service, Industrial Skin Diseases, March 27.
Dr. William A. Sawyer, medical director, Eastman Kodak Company, Rochester, N. Y., Profits in an Industrial Health Program, April 3.
Dr. Edward C. Holmblad, medical director, Railway Express Agency, Chicago, Preplacement and Periodic Physical Examinations, April 10.
Mrs. Irene Willoughby, R.N., industrial nursing consultant, Liberty Mutual Insurance Company, Industrial Nursing Consultation from the Insurance Viewpoint, April 17.
Mrs. William J. Connolly, director, state department of labor, State Department of Labor and the Workers' Health, April 24.
Miss Catherine R. Dempsey, R.N., director of nurses, Simplex Wire and Cable Company, Work of the Nurse in Industry, May 1.
Mr. Jesse C. Williams, R.N., director of nurses, Pratt and Whitney Aircraft Division, United Aircraft, In-Plant Training for the Industrial Nurse, May 8.

The series was arranged by the Rhode Island Society of Industrial Physicians and Surgeons and the Rhode Island Industrial Nurses' Club in conjunction with the industrial health committee of the Rhode Island Medical Society.

TEXAS

Meeting of Pathologists.—At the annual meeting of the Texas Society of Pathologists in Dallas, January 28, it was voted unanimously to affiliate with the Texas Academy of Science, which is a part of the American Association for the Advancement of Science. Officers of the society include Drs. Paul Brindley, Galveston, president; May Owen, Fort Worth, president-elect; Sidney W. Bohls, Austin, vice president; John J. Andujar, Fort Worth, secretary-treasurer, and Charles T. Ashworth, Dallas, secretary-treasurer-elect. The Texas Society of Pathologists has drawn up a model bill to be presented to the legislature establishing a modern medical examiner system. The present law in Texas permits justices of the peace to serve as coroners and medical examiners.

Educational Lectures.—Dr. J. Arnold Borgen, Rochester, Minn., lectured at the University of Texas Medical Branch, Galveston, under the auspices of Phi Chi medical fraternity. His subject was "Modern Concepts of Intestinal Infection." Dr. Walter C. Alvarez, Rochester, gave the annual Phi Beta Pi Lecture at the school March 2 on "Nervous Indigestion." Dr. James S. Plant, the director of the Essex County Juvenile

Clinic, Newark, N. J., presented the William Buchanan Lecture at the school, March 5, speaking on the principles of management of psychologic problems in children. Dr. Plant participated in a conference on psychologic and psychiatric problems in children, March 9, at the Hotel Stephen F. Austin, Austin. The conference was sponsored by the University of Texas Child Health Program, the Texas Section of the American Academy of Pediatrics, the Texas Pediatric Society, the Texas Society for Mental Hygiene, the Hogg Foundation of the University of Texas and the children's division of the state department of public welfare. Other speakers included Dr. Milton E. Kirkpatrick, director of the Guidance Center of New Orleans, and Dr. John H. Waterman, director of the Guidance Center of Houston.

Recommendations to Curb Tuberculosis in San Antonio.—*Public Health Reports*, February 2, discusses a recent survey of the U. S. Public Health Service in San Antonio, which has the highest tuberculosis death rate of any large city in the United States. Recommendations are presented to overcome the disease, which is the second leading cause of death in the city for persons of all ages. One out of every ten deaths is from this disease. Heart disease, including coronary disease, is the chief cause of death, forming 15.2 per cent of the total deaths. A chest x-ray survey of more than 20,350 residents, of whom almost 19,000 were Latin-American, revealed 993 persons, or 4.9 per cent, with reinfection tuberculosis. The survey took four months. Similar surveys in various sections of the county reveal that an average of approximately 1 per cent of the population has reinfection tuberculosis. More than 90 per cent of the persons examined were of Latin-American extraction, only a small number were colored. Very small differences in the proportion of reinfection of tuberculosis were observed between the Anglo-Americans and the Latin-Americans. Among the 1,277 Anglo-Americans, 71 cases of reinfection tuberculosis, comprising 5.5 per cent of the group, were found. Among 18,607 Latin-Americans, 914 cases were discovered, or 4.9 per cent. The rates were higher among the males than among the females both in the Latin-American and in the Anglo-American groups. The creation of an office of tuberculosis control in the city health department and the appointment of a full time physician as director are considered essentials in the development of a control program which would include a permanent plan of case finding, clinical care, sanatorium treatment and follow-up with rehabilitation being implemented in cooperation with all interested agencies.

WEST VIRGINIA

State Meeting Canceled—The seventy-eighth annual meeting of the West Virginia State Medical Association, which was scheduled for Clarksburg, May 14-15, has been canceled. This will be the first year that an annual session has not been held by the association since its organization in 1867.

Positions Available—The Merit System Council of the State of West Virginia recently announced a number of miscellaneous positions available throughout the state. The positions include those of deputy state health commissioner, director of maternal and child hygiene, assistant director of maternal and child hygiene, director of communicable diseases, director of venereal disease control and director of public health education, as well as miscellaneous positions as local health officer, bacteriologist, nutritionist consultant and public health nursing supervisors. A position is also available as chief of medical services in the department of public assistance and one as cancer control education consultant. State residence requirements for these positions have been waived. Additional information may be obtained from the Merit System Council, 212 Atlas Building, Charleston 1.

Actions of State Medical Society—At a meeting January 18 the council of the West Virginia State Medical Association rejected a proposal of the legislative committee that pathologists be licensed by the public health council to practice in the state. The proposal, previously unanimously approved by the legislative committee, would have required applicants to have an M.D. degree to have resided in a community in West Virginia for at least two years, to be citizens of the United States, to have the endorsement of the local medical society and to pass such examination as might be required by the public health council. A committee of five members has been named to work out details for providing psychiatric education for members of the state medical association as the result of the report on the returns of more than five hundred psychiatric questionnaires sent to members. Returns indicated that the majority favored some sort of psychiatric education through the medium of local society meetings and articles in the state journal.

GENERAL

Statistical Bulletin Completes Twenty-Five Years—The Statistical Bulletin of the Metropolitan Life Insurance Company with its January issue announces its completion of twenty-five years. An editorial by Louis I. Dublin, Ph.D., New York, lauds the bulletin for its usefulness as a medium in public health education.

Examination in Internal Medicine—The next written examination of the American Board of Internal Medicine will be held on October 15. The closing date for filing applications is August 1. Candidates in the armed forces may take the written examination at their station with the permission of their medical commanding officer. Dr. William A. Werrell, 1301 University Avenue, Madison 5, Wis., is the assistant secretary-treasurer of the board.

Tuberculosis Association Surveys Activities—The National Tuberculosis Association has launched a five year survey of all educational activities of its organization to evaluate and improve the materials and methods in use at the present time as well as to formulate a constructive program for the future. According to the *Bulletin* of the National Tuberculosis Association, the study will extend over the period of 1945-1950 and will involve a thorough analysis of the organization's personnel needs and the selection of pilot centers on a local level in cooperation with state associations. A technical or steering committee, under the chairmanship of Werrett W. Charters, Ph.D., director of research, Stephens College, Columbia, Mo., will work with four associated committees on program materials, personnel training and pilot study. The technical committee is composed of Dr. Charters, Dr. Herman E. Hilleboe, chief, tuberculosis control division, U. S. Public Health Service, and Dr. Kendall Emerson, managing director of the National Tuberculosis Association and the chairman of the other four committees. In addition to the working committees a national advisory committee will be appointed, made up of persons prominent in the fields of public health, welfare and education. Service heads at the national office will constitute a staff resource committee available for consultation whenever necessary.

Footprinting of Infants—The procedure of taking footprints is explained in an article entitled "Footprinting of Infants," published in the January Law Enforcement Bulletin of the Federal Bureau of Investigation. Individuality, continuity and immutability are three features of any system for personal identification purposes, the bulletin states. Identification by fingerprints, palmprints or footprints is the only method of personal identification which satisfies all of these requirements. The friction areas of the fingers, palms and feet have papillary ridges which form well defined patterns and contain distinctive characteristics. The possibility of any two human beings having surface areas of skin on their fingers, palms or feet which have exactly the same ridge characteristics is so remote that it is beyond the realm of probability. In explanation of these three features it is stated that the definitive formation of the ridges on the palms, fingers and feet of human beings begins several months before birth and remains throughout the entire lifetime. These ridges are intact after death up until the time decomposition of the body takes place. During the entire lifetime of a human being the ridges on his hands and feet remain exactly in their original formations and cannot be changed. The majority of hospitals today are using the methods of footprints for identification of infants in preference to fingerprints or palmprints. The reason for this is that the ridges are more pronounced on the feet and it is easier to obtain prints of this surface from newborn babies. The purpose of taking footprints is to provide a permanent record of individuality so that, in the event of a question arising later as to the identity of the child and its mother, conclusive proof of its identity can be offered. The footprints of the infant, therefore, should be taken immediately after birth. The equipment required for taking footprints is inexpensive and easy to obtain and requires but little training to use. It consists of printer's ink (a black heavy paste), a roller and an inking plate (a small piece of plate glass). Ordinary writing ink, colored ink and stamp pad ink are not very satisfactory mediums because they are too light or too thin and take too long to dry. The roller best adapted to this work is similar to that used by printers in making galley proofs and should be about 3 inches long and 1 inch in diameter. In preparing to take a set of impressions a small dab of ink should be placed on the inking glass and thoroughly rolled until a thin even film covers the entire surface of the glass. To insure best results, the area of the feet to be printed should be thoroughly dried by wiping with a piece of gauze. The ink may be applied directly to the m. it's feet

from the roller, but care should be exercised to insure a very thin film of ink on the portion of the foot to be printed. The inked area is then pressed firmly on the surface of the card or certificate, but caution must be used to avoid either the foot or the paper being moved during the printing process in order to avoid smudging the print. Too much ink and too much pressure will result in a mere blot on the card, which of course is of no value for identification purposes.

Absentee Sickness Rate Soars to Reflect Wartime Conditions.—Absenteeism due to sickness among male industrial workers showed a substantial increase for the third quarter of 1944, sending the total industrial sickness rate in this year up to 37 per cent above the average for the period 1935-1944, according to statistics released by the Industrial Hygiene Division of the U. S. Public Health Service. Nonrespiratory-nondigestive diseases rose 15 per cent above a like period in the previous year. Conditions contributing to this record included a 26 per cent increase in rheumatism, a 29 per cent increase in neurasthenia and other diseases of nervous or mental origin and a 34 per cent increase in diseases of the genitourinary system. The incidence of rheumatic diseases, diseases of the heart and arteries, nephritis and nervous diseases has never been equaled or exceeded within the past decade. Nervous diseases showed the highest rate of increase, rising 76 per cent above the ten year mean. The rate of respiratory diseases, while slightly lower than in 1943, was 32 per cent above the average for the decade. Digestive diseases also rose to a rate exceeding anything experienced within the ten year period. Employment conditions peculiar to wartime are held responsible. Categories of disease showing the highest increase involve mainly older workers. The hiring of workers long unemployed or retired is one factor held to contribute to the record sickness rate, as is the employment of youths and other inexperienced personnel and the necessity for employing in industry men rejected by the armed services. Wartime working and living conditions are thought to be reflected, since other factors held accountable include emotional strain and personal mental conflict, overcrowding in plants and war communities, fatigue due to the lengthened work week, and night work.

FOREIGN

Jeffries Award Goes to Sir Harold Whittingham.—The John Jeffries award for outstanding contributions to aviation medicine was awarded January 31 to Air Marshal Sir Harold E. Whittingham, director of Royal Air Force medical services (THE JOURNAL, Sept. 30, 1944, p. 313). The presentation was made by Major General David N. W. Grant, Air Surgeon of the U. S. Army Air Forces, during a meeting of the Institute of Aeronautical Sciences in New York.

Committee Named for Trypanosomiasis.—The British Secretary of State for the Colonies has appointed a tsetse fly and trypanosomiasis committee to consider and advise on the coordination of action, including research, directed against human and animal trypanosomiasis and, in particular, against the tsetse fly as the chief vector, according to *Science*. The committee, on which the Dominions Office and the Sudan government are represented, will report from time to time to the Secretary of State for the Colonies, and on all matters affecting research its recommendations will be referred to the Colonial Research Committee for comment and advice before submission to him.

Deaths in Other Countries

Henry Dreyfus, D.Sc., chairman and managing director of British Celanese Ltd., and known as a physician, chemist, industrialist and financier, died Dec. 30, 1944, a week before his sixty-third birthday.—**Sir Buckston Browne,** prominent physician and benefactor of the Royal College of Surgeons, died recently, aged 94.—**Sir Henry Gauvain,** since 1908 medical superintendent of Lord Treloar Cripples' Hospital and College, Alton and Hayling Island, died January 19.—**Dr. Frederick W. Eurich,** known for his work against anthrax, died in Southampton, England, February 16.

CORRECTION

Stiff Neck and Meningeal Irritation.—In THE JOURNAL, February 24, page 438, in the discussion of Dr. Toomey's paper by Dr. Hoyne, the statement that, "if the diagnosis is verified either by a blood culture or possibly by a smear from petechiae in the skin, usually a lumbar puncture is necessary" should read ". . . is not necessary."

Government Services

Jack Masur Succeeds Dean Clark

Jack Masur, surgeon, U. S. Public Health Service Reserve, has been appointed chief medical officer in the Office of Vocational Rehabilitation, Federal Security Agency, to succeed Dean A. Clark, senior surgeon, U. S. Public Health Service Reserve. Dr. Clark has been on leave of absence recently on a special project and will soon be transferred to a special assignment in the Office of the Surgeon General of the Public Health Service. Dr. Masur, who has been serving as assistant chief medical officer since April 1, 1944, had previously been assigned as hospital administration specialist to the U. S. Office of Civilian Defense. Victor H. Vogel, surgeon, U. S. Public Health Service, whose appointment as consultant in psychiatry was recently announced, has been assigned assistant chief medical officer.

Sale of Penicillin

Proposed procedure for gradual elimination of existing control over distribution of penicillin for civilian use and simultaneous diversion of the drug into normal trade channels for sale without restriction was outlined to the penicillin industry advisory committee at its recent meeting in Washington by Fred J. Stock, chief of the drugs and cosmetic branch, War Production Board. Mr. Stock made no promise as to the specific date on which the change would be undertaken, but it is understood that, barring unforeseen heavy demands by the military or some other unforeseen difficulty, it can become an accomplished fact within several months. According to *Drug Trade News*, Mr. Stock said he proposes to "release the brakes" gradually, retaining the existing Civilian Penicillin Distribution Unit, under John N. McDonnell, in Chicago, until it is certain that distribution is operating smoothly through trade channels. Penicillin production is now above the 400 billion unit mark each month, it was stated, and the 2,700 hospitals acting as distributing agents under the controlled distribution plan are now receiving about 35 billion units a month, the remainder going to the armed forces. Sufficient advance notice of the date of the change over from controlled distribution to distribution through usual trade channels would be given so that manufacturers can plan promotion campaigns, it was stated.

Graduate Work in Health Education

Fellowships for graduate work in health education are being offered to qualified applicants by the U. S. Public Health Service in cooperation with the National Foundation for Infantile Paralysis, Surgeon General Thomas Parran has announced. These fellowships for the collegiate fall term of 1945 are being awarded to meet present and future needs for trained health educators in schools, communities and local, state and federal health departments. Men and women between the ages of 22 and 40 who are citizens of the United States and who hold a bachelor's degree from a recognized college or university may apply. Fellowships will lead to a master's degree in public health. The twelve months training period will consist of nine months in the School of Public Health at the University of North Carolina, Yale University or the University of Michigan and three months' field experience in community health education under supervision. Applicants must meet the requirements for admission to the schools of public health. Training in science, sociology, education and psychology, plus experience working with people, are desirable prerequisites. The fellowships provide a stipend of \$100 a month for twelve months, full tuition and travel for field experience. Candidates must pay their travel to and from the university at the beginning and end of training. "The existing shortage of trained health educators and the demand for expansion of health education activities indicated both in this country and abroad highlight the need for qualified personnel with a thorough understanding of both public health and education," the Surgeon General said. Basil O'Connor, president of the National Foundation for Infantile Paralysis, pointed out that coordination of official and voluntary agencies on a community basis will make available the services of competent health educators, whose aid will be invaluable in solving community health problems. He stressed the assistance to be given by such a group during an infantile paralysis outbreak in informing residents about the disease and the necessity for long continued after-care of patients. Fellowship application forms may be obtained from the Surgeon General, U. S. Public Health Service, Washington 14, D. C. Applications must be accompanied by a transcript of college credits and a small photograph and must be in the office of the Surgeon General not later than June 1.

How Science Saved Britain

Speaking at a meeting of the British Association for the Advancement of Science, Lord Woolton, minister of reconstruction, said that the policy of the British government during this century of giving little support to men of science had brought the country near defeat in the war. We remained unprepared either to breed a nation that would be physically fit or to grow and store enough food to ensure ourselves against the growing dangers of submarine warfare, which were known to our naval scientists. Within a few weeks of Lord Woolton's taking office in April 1940 as minister of food we were faced with a drop of 50 per cent in our food imports. We were saved from starvation by the application of scientific knowledge to the problem of securing the right foods, not to satisfy our appetites but to give us nutrition. At the same time scientific research applied to agriculture was making possible increase in the yield of land beyond expectations. Now in the sixth winter of the war, in which the scientist had played such a conspicuous part, our standards of health are well maintained and in many respects improved, while agriculture has been serving a great national purpose.

From the first, he pointed out, this has been a scientific war. In the early stages, used defensively, science helped to stave off defeat; now in the offensive stage it was making victory possible. Even more significant was the application of the scientific method in the operational field. Eminent scientists were found at the right hand of our military, naval and air strategists, applying to combat the same scientific methods which they used in peacetime research. They had been at work on problems of civil defense, combined operations, the defeat of U boats and even of operations on the battlefield. In the great experiment in reconstruction to be launched when the war is over the scientist can play a part as great as that which he has played in war. War experience on food and nutrition has provided many practical examples of what must survive in the postwar world. Thus, said he, we can save not only human suffering but millions of pounds a year previously wasted in physical ill health and consequent industrial incompetence.

Proposed Academy of Medicine

The three Royal Colleges—of Physicians, of Surgeons and of Obstetricians and Gynecologists—which represent the main divisions of the medical profession have originated independently at different periods and occupy different sites in London. In a letter to the *Times* a leading ophthalmic surgeon, Sir Stuart Duke-Elder, recalls that about two years ago he wrote advocating the unification of the many bodies which today represent the academic aspects of medicine and points out that the arguments then advanced have greater force today. It is eminently desirable that there should be an authoritative body which could uphold and foster the scientific progress of medicine, maintain professional standards, particularly at the consultant level, and stimulate research. In every liberated country of Europe which he visited Duke-Elder saw the eagerness with which the doctors and scientists look to Britain for a cultural lead to replace the hegemony hitherto exercised from Berlin. The creation of the center in London which could represent worthily all the academic aspects of medical practice would add much to our cultural and political influence.

The first essential step toward this unification would be to bring together on a common site the three Royal Colleges. There is an opportunity for this, as the Royal College of Sur-

geons has recently acquired the freehold of adjacent property. This would double their accommodations and allow sufficient space for the other two colleges. Duke-Elder urges that the present opportunity be seized and a substantial step forward be taken for founding an academy of medicine. His proposal has received impressive support from the leaders of the profession.

Lord Dawson, past president of the Royal College of Physicians and president of the British Medical Association, states that for many years the need of an academy of medicine has been felt in the profession in order to gather the Royal Colleges and the increasing number of specialties and other activities into a coherent whole. The principal specialties—orthopedics, radiology, anesthetics, otolaryngology and ophthalmology—have decided to make their homes on the new site acquired by the Royal College of Surgeons and are already settled there.

Sir Alfred Webb-Johnson, president of the Royal College of Surgeons, states that for some years the council has had in mind the desirability of forming an academy of medicine, and, in order to provide an opportunity for this, acquired adjacent sites, which are adequate for the requirements of all three colleges and the specialist associations. The council favors Lincoln's Inn Fields (where the college is), because of its advantages and amenities. Lincoln's Inn Fields is the largest square in London. It is a quiet area and has an academic atmosphere, which has been created by the legal society which has its home there. The location is central and accessible and is known throughout the world as the site of the famous Hunterian Museum. The college is prepared to put to common use its facilities—conference rooms, museums, laboratories and library. In support of Duke-Elder's plea Lord Horder says that the formation of an academy of medicine, apart from many obvious advantages to medicine, would enable the profession to speak with one voice where national interests are concerned.

Sir Thomas Barlow

Sir Thomas Barlow has died in his hundredth year. After a distinguished student's career he qualified in 1871. In 1876 he was appointed assistant physician to Charing Cross Hospital and in 1878 exchanged this post for a similar one at the London Hospital. In 1880 his old teachers at University College Hospital invited him to return as assistant physician. He was professor of clinical medicine at University College from 1895 to 1907. He was distinguished as a great clinical observer. He would spend much time on any case that presented a new combination of symptoms. Early in his career he published, in conjunction with Samuel Gee, another great clinician, a paper on cervical opisthotonos in which simple or basic meningitis (now known as meningococcal meningitis) was differentiated from tuberculous meningitis. Rickets was another disease on which he made important observations. With Lees he inquired into the relationship of congenital syphilis and rickets. They found that in 47 per cent of the cases in which craniotables with bosses on the frontal and occipital bones occurred in rickets there was a certain history of congenital syphilis. At the International Congress of Medicine in 1881 he showed, in conjunction with Warner, the frequency and clinical significance of subcutaneous tendinous nodules in acute rheumatism of children. Their view that the nodules indicate concurrent and usually progressive heart disease was confirmed by other observers. He pointed out the parallelism between intermittent hemoglobinuria and the paroxysmal attacks of Raynaud's disease. He suggested that other visceral paroxysmal disorders might be found in these cases comparable to the temporary enlargement of the spleen sometimes found in hemoglobinuria. This suggestion he later verified. He is best known for his work on infantile scurvy. The disease had previously been described, but it was generally confounded with rickets. Barlow proved its identity with the scurvy of adults. His work so

impressed the Germans that they termed the condition "Barlow's disease." His work had an important effect on infant feeding at a time when artificial foods and sterilized milk were becoming popular. He was physician to three British sovereigns and the recipient of numerous distinctions. At the age of 87 he received in person the gold medal of the Royal Society of Medicine at its annual dinner. He was president of the International Medical Congress held in London in 1913.

British Casualties in the War Amount to a Million

The official report of British casualties in the fighting forces in the war from Sept. 3, 1939 to Nov. 30, 1944 has been issued. The total for the whole British Empire is 1,043,554. This consists of 282,162 killed, 80,580 missing, 386,374 wounded and 294,438 prisoners of war. Of the casualties 635,107 come from Britain, 78,985 from Canada, 84,851 from Australia, 34,115 from New Zealand, 28,943 from South Africa, 152,597 from India and 28,946 from the colonies. These figures are not the total casualties, for they exclude civilian casualties due to enemy action and casualties of merchant seamen.

BUENOS AIRES

(From Our Regular Correspondent)

Jan. 20, 1945.

National Department of Public Health

Dr. Manuel Augusto Viera, director of public health in Argentina, has officially described the laws pertaining to public health. The Department of Public Health will increase and improve the various centers of medical care, preventive medicine and general and preventive hygiene. People will have periodic medical examinations, free of charge. The results of these and the statistics of the conditions of health of the people will be made public. Dr. Viera states that the new subsidies will lead to a better national health service. Subsidies granted by the Central Department of Public Health to provincial health centers will be apportioned to the needs of the centers, which will be operated as branches of the central department, with due consideration to local autonomy. If the functions of public health centers are found to require more centralization, the regulations will be modified in accordance with the circumstances. Sanitary posts for administration of medical and preventive care will be established in isolated regions. The sanitary posts will be connected with regional hospitals, which in turn will be connected with larger specialized hospitals. Regional sanitary delegations have been established in Tucuman, Santa Fe, Mendoza and Bahia Blanca. The offices of international health, the office of coordination of passive anti-air defense and the committee on the pharmacopeia and on alimentation will depend directly on the Central Department of Public Health.

Meeting of Industrial Physicians

The second meeting of industrial physicians was recently held in Buenos Aires under the auspices of the Instituto Argentino de Seguridad. Dr. Ismael Urbandt of the National Department of Public Health presided. Delegates were present from Brazil, Chile and Uruguay. Dr. César Corti Maderna, representing the board of officers of the Instituto Argentino de Seguridad, emphasized the importance of social medicine for workers and the importance of preventing accidents and diseases either general or industrial. Centers for medicosocial services have been organized and new centers are to be organized. The Instituto Argentino de Seguridad feels the importance of medical industrial congresses for the establishment of measures for the prevention of accidents, the recovery and reeducation of incapacitated workers after accidents and the orientation and training in trades suited for those who are incapacitated after accidents. Studies of workers with heart disease should be carried on to obtain information to serve as a basis for regulations to aid these persons.

Topics discussed at the meeting included brucellosis, silicosis, industrial hernia, dermatosis in metal burnishers, dermatosis from contact with bakelite, medical prevention of industrial dermatosis, observations on punctate erythrocytes of workers in industries which may lead to lead infection (Dr. Ismael Urbandt and Mario P. Francone), effort lumbago and protrusion of intervertebral disks. Other topics discussed included cardiac workers, psychologic problems and organization of industrial medicine. The importance of organizing an institute of industrial medicine and the need of providing proper laws and proper health insurance for industrial workers was emphasized.

Samples of Drugs

While Dr. Galli was director of public health in Argentina a law was passed prohibiting the giving of samples to physicians and hospitals by drug laboratories. The law met with disapproval. Liberal donation of samples is an old practice in the country and a good form of aiding poor patients in the hospitals. Dr. A. Viera, present director of public health, recently denounced the law. Distribution of samples of drugs as a donation of drug laboratories to physicians and hospitals is necessary to verify the claims concerning the pharmacologic effects and therapeutic uses of drugs. The Department of Public Health recently passed a new law requiring the exportation of drugs and the preparation of drugs to be exported to be supervised by the Department of Public Health.

Laws for Practice of Medical Specialism

According to recent action by the National Department of Public Health of Argentina specialists will be classified in the following medical branches: (a) urology, (b) gynecology, (c) dermatosyphilology, (d) otorhinolaryngology, (e) ophthalmology, (f) gastroenterology, (g) rheumatism, (h) pediatrics, (i) proctology, (j) endocrinology, (k) cardiology and circulatory diseases and (l) neurology and psychiatry. No other classification will be recognized.

South American Congress of Pediatrics

The first South American Congress of Pediatrics was held in Santiago, Chile, the last week of November 1944 with participation of Argentina, Bolivia, Chile, Peru and Uruguay. Drs. Andrade Marín of Quito, Ecuador, and Félix Hurtado of Havana, Cuba, were specially invited to the congress.

Marriages

ASHBEL C. WILLIAMS, Jacksonville, Fla., to Miss Kathleen Margaret Bainton Donaghue at Tavistock, Devon, England, December 24.

JAMES ALLEN MEADOWS JR., Birmingham, Ala., to Miss Mildred Evans Barnes of Andalusia, December 16.

KENNETH F. LAWS to Miss Betty J. Lahrman, both of Lafayette, Ind., at South Bend, November 9.

ROBERT O. PITTS III, Nashville, Tenn., to Miss Clementeene Pearson of Sarasota, Fla., December 23.

MURRAY P. WHIGHARD, Murphy, N. C., to Miss Willettta Evans of Gulfport, Miss., December 26.

JOSEPH STOMEL to Miss Wilhelmina R. Gollum, both of Los Angeles in Yuma, Ariz., February 18.

THOMAS GRASTY BELL, Staunton, Va., to Miss Louisa Lile Tucker of Cleveland, December 24.

BELTON J. WORKMAN, Woodruff, S. C., to Miss Kathleen Bruton of Conway, December 27.

LEON L. RACKAW, Forest Hills, N. Y., to Miss Doris Starkman of Brooklyn, February 11.

FRANK W. FORDYCE to Mrs. Jessie Weese, both of Des Moines, December 27.

KATHRYN E. CAMPBELL, Boonville, Ind., to Lieut. John L. Susott, January 11.

Deaths

Lawrence Getz * Ancon, Canal Zone; Johns Hopkins University School of Medicine, Baltimore, 1918; a first lieutenant in the medical corps of the U. S. Army in France from June 1917 to February 1919; interned at the City Hospital at Bay View, Baltimore; served as resident physician at the Hospital Santo Tomas, Panama, Republic of Panama, where he had been chief of the laboratory from 1926 to 1929 and again from 1942 until his death; assistant instructor in pathology at his alma mater and at the University of Maryland School of Medicine, Baltimore, 1923-1924; joined the staff of the Herrick Clinic and the Hospital de Panama in July 1929, serving until 1941; specialist certified by the American Board of Internal Medicine; fellow since 1929 of the American College of Physicians and governor of the college for Panama and the Canal Zone in 1941-1942; in 1928 president of the Medical Association of the Isthmian Canal Zone; member of the National Medical Association of Panama; in 1927 at the annual session of the American Medical Association in Washington, in collaboration with others, awarded a Bronze Medal for an exhibit illustrating the diagnosis, etiology and pathology of infection with *Endameba histolytica*, and at the 1934 session in Cleveland, also with others, the Class II Gold Medal for excellence of presentation of an exhibit illustrating diagnosis and pathology of human amebiasis; decorated with a diploma of Merit by the Republic of Ecuador; died in the Hospital Santo Tomas, Panama City, November 29, aged 52, of lymphosarcoma.

Elmer Lawton Kenyon * Chicago; Rush Medical College, Chicago, 1896; retired in 1937 with the rank of associate clinical professor emeritus of laryngology and otology at his alma mater, where in 1910 he established the second clinic for disorders of the voice and speech in the United States; specialist certified by the American Board of Otolaryngology; one of the founders of the American Society for the Study of Disorders of Speech, now the American Speech Correction Association, of which he had been president from 1928 to 1932; president of the Chicago Laryngological and Otolological Society in 1919, the Jackson Park Branch of the Chicago Medical Society, 1917-1918, and of the alumni association of Rush Medical College, 1922-1923; member of the American Laryngological Association; member of the House of Delegates of the American Medical Association in 1917; fellow of the American College of Surgeons; discovered the function of the extrinsic musculature of the larynx, in addition to various other contributions to this field; author of section "Defects of Speech of Congenital, or Developmental Origin" in *Abt's Pediatrics*, 1925; died February 1, aged 79, of cerebral hemorrhage and arteriosclerosis.

Mark J. Schoenberg * New York; Universitatea din Bucuresti Facultatea de Medicina, Rumania, 1900; specialist certified by the American Board of Ophthalmology; member of the American Academy of Ophthalmology and Otolaryngology and the American Ophthalmological Society; founder and president of the New York Society for Clinical Ophthalmology; chairman of the committee on glaucoma of the National Society for the Prevention of Blindness; in 1914 received the Lucien Howe Medal of the Medical Society of the State of New York for essay on "Contribution to the Experimental Study of Ocular Anaphylaxis"; for many years instructor in ophthalmology at the Columbia University College of Physicians and Surgeons; served as consulting surgeon to the Manhattan Eye, Ear and Throat Hospital; consultant ophthalmologist at the Bronx Hospital and the Presbyterian Hospital; attending surgeon at the Herman Knapp Memorial Hospital for many years, serving as chief in the glaucoma clinic until his retirement as surgeon emeritus; member of the board of editors of the *Sight-Saving Review*; died in the Mount Sinai Hospital February 15, aged 70.

Thomas Aloysius Martin, New York; Columbia University College of Physicians and Surgeons, New York, 1900; member of the American Medical Association; fellow of the New York Academy of Medicine; member of the executive committee of the American Heart Association; formerly adjunct professor of therapeutics at the Fordham University School of Medicine and clinical professor of medicine at the New York University College of Medicine; served overseas with the Harlem Hospital unit of the U. S. Army during World War I; medical director and for many years visiting physician at St. Vincent's Hospital, where he was chairman of the school of nursing committee; on the staff and formerly medical director of the Harlem Hospital; on the staffs of the Columbus Hospital, French Hospital and New York Infirmary for Women and Children; died January 5, aged 71, of cerebral hemorrhage.

Albert Joseph Bertram, Miami, Fla.; Jefferson Medical College of Philadelphia, 1912; interned at the Lancaster General Hospital, Lancaster, Pa.; a licensed pilot; served as a director of the Greater Miami Airport Association and as chief starter for all the races in connection with the All American Air Maneuvers; member of the American Medical Association; commissioned lieutenant commander in the medical corps, U. S. Naval Reserve, on May 31, 1938 and commander (temporary) on July 13, 1942; aviation medical examiner and flight surgeon; served at Gaudalcanal, where he was wounded; the recipient of the Purple Heart; placed on the retired list as a result of physical disability on Feb. 14, 1944; died in the U. S. Naval Hospital, Bethesda, Md., Nov. 4, 1944; aged 53, of coronary thrombosis.

William Irving Wiggin * Lowell, Mass.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1901; specialist certified by the American Board of Otolaryngology; member of the American Academy of Ophthalmology and Otolaryngology and the New England Otolological and Laryngological Society; fellow of the American College of Surgeons; vice president of the Middlesex North District Medical Society; formerly instructor in laryngology at the Harvard Medical School, Boston; served overseas for eighteen months with a Red Cross unit during World War I; consultant surgeon, Massachusetts Eye and Ear Infirmary, Boston; on the staff of the Lowell General Hospital, where he died January 3, aged 65, of mesenteric thrombosis.

John Joseph Laughlin, Mount Carmel, Pa.; Georgetown University School of Medicine, Washington, D. C., 1935; interned at the Mercy Hospital in Wilkes-Barre; served a residency at the Ashland State Hospital, Ashland, and the Pennsylvania State Tuberculosis Sanatorium number 1 in South Mountain; commissioned a first lieutenant in the medical corps, Army of the United States, on Sept. 14, 1942 and served until relieved from active duty on Jan. 13, 1944; received a medical discharge on Feb. 4, 1944; assistant surgeon at the Bethlehem Steel Company, Sparrows Point, Md.; died in the Geisinger Memorial Hospital, Danville, December 2, aged 36, of carcinoma of the head of the pancreas.

Nathaniel Holder Adams * Oak Park, Ill.; Northwestern University Medical School, Chicago, 1896; also a pharmacist; died January 20, aged 74, of respiratory paralysis due to amyotrophic lateral sclerosis.

Arthur Elmer Ballard, Belton, Texas; Fort Worth School of Medicine, Medical Department of Fort Worth University, 1905; member of the American Medical Association; director of the Central Texas Health unit; formerly officer of the Laredo-Webb County Health Unit; part owner of the Belton General Hospital; died in Lockhart December 30, aged 67, of heart disease.

Walter Herman Becker, Portland, Ore.; Willamette University Medical Department, Salem, 1907; died in the Good Samaritan Hospital December 27, aged 70, of coronary occlusion.

John William Henry Belote, Wills Point, Texas; University of Tennessee Medical Department, Nashville, 1901; member of the American Medical Association; died in Fort Worth, December 14, aged 77, of myocarditis.

Frederick Binder, Corning, Iowa; St. Louis University School of Medicine, 1911; member of the American Medical Association; chairman of the board of municipal utilities; died in the Clarkson Hospital, Omaha, October 17, aged 69.

John Ambrose Clark Busby, Oak Park, Ill.; University of Nebraska College of Medicine, Omaha, 1921; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; member of the American Medical Association, Central Association of Obstetricians and Gynecologists, the Chicago Gynecological Society and the Oak Park Physicians' Club; senior member of the obstetric staff, West Suburban Hospital, where he died January 5, aged 51, of cerebral hemorrhage.

James W. Charters, Buffalo; University of Buffalo School of Medicine, 1895; for many years surgeon for the New York Central Railroad; member of the courtesy staff of the Millard Fillmore Hospital; died January 1, aged 74, of coronary thrombosis.

James Henry Clark, Montclair, N. J.; College of Physicians and Surgeons, New York, 1881; member of the American Medical Association; for thirty-four years police surgeon in Newark; for many years on the staffs of St. Michael's Hospital and the Hospital of St. Barnabas and for Women and Children in Newark; member of the William Pierson Medical Library Association and the Newark Historical Society; died January 1, aged 89, of chronic myocarditis.

Joseph Howard Cooper @ East Millstone, N. J.; Medico-Chirurgical College of Philadelphia, 1891; school physician; on the courtesy staff of the Somerset Hospital, Somerville, where he died December 31, aged 77, of coronary occlusion.

Robert Lee Downey, Monticello, Ark. (licensed in Arkansas in 1906); died December 16, aged 71, of injuries received in an automobile accident.

Edward Herman Eyerman @ St. Louis; St. Louis College of Physicians and Surgeons, 1898; on the staffs of the Lutheran and St. Anthony's hospitals; died January 2, aged 70, of coronary thrombosis.

James Francis Faulkner, New York; Harvard Medical School, Boston, 1913; member of the American Medical Association; decorated for service during World War I; died in the New York Hospital January 1, aged 60, of acute pyelonephritis of the remaining left kidney.

Henry Louis Field, St. Louis; Marion-Sims College of Medicine, St. Louis, 1891; died November 22, aged 84.

Reuben Harrison Fields, Gardiner, Ore.; Southern Homeopathic Medical College, Baltimore, 1897; member of the American Medical Association; served during World War I and as a member of the American Red Cross in Siberia; formerly on the staff of the Keizer Brothers Hospital, North Bend; died December 9, aged 71, of coronary thrombosis.

Alexander D. Ghiselin Sr., Southbury, Conn.; Marion-Sims College of Medicine, St. Louis, 1894; veteran of the Spanish-American War; died January 6, aged 72, of heart disease.

George Harper Holt @ Cincinnati; Miami Medical College, Cincinnati, 1902; on the staffs of the Bethesda Hospital and the Christ Hospital, where he died December 31, aged 71, of diabetes mellitus.

Willoughby E. Kittredge, Napolconville, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1899; died in New Orleans December 23, aged 71, of bronchopneumonia.

Eli French Knox, Lexington, Ky.; Hospital College of Medicine, Louisville, 1905; died in the Good Samaritan Hospital December 17, aged 77, of arteriosclerotic heart disease.

Lemuel Weyher Kornegay @ Rocky Mount, N. C.; North Carolina Medical College, Davidson, 1906; honorary member of the Medical Society of the State of North Carolina; a founder and chief surgeon of the Rocky Mount Sanitarium; died December 18, aged 63, of coronary occlusion.

Michael Saul G. Landa, New York; University of Dorpat Faculty of Medicine, Russia, 1900; member of the American Medical Association; died January 1, aged 70, of heart disease.

Martha A. McCullough Link @ Dubuque, Iowa; Milwaukee Medical College, 1909; died in the Mercy Hospital December 1, aged 59, of fibrosarcoma of the left shoulder.

William Franklin Lockwood, Edwardsburg, Mich.; the Hahnemann Medical College and Hospital, Chicago, 1894; died December 3, aged 80, of senility.

George Henry Martin, Pasadena, Calif.; Boston University School of Medicine, 1881; at one time professor of mental and nervous diseases at the Hahnemann Hospital College of San Francisco; died December 16, aged 85, of arteriosclerosis and senility.

Nall Carroll McCown, Forrest City, Ark.; Louisville and Hospital Medical College, Louisville, Ky., 1908; member of the American Medical Association; past president of St. Francis County Medical Society; served as city and county health officer; veteran of the Spanish-American War and World War I; died November 25, aged 61, of acute hepatitis.

Alfred Clifton McDaniel, San Antonio, Texas; Bellevue Hospital Medical College, New York, 1892; member of the American Medical Association; died in the Nix Hospital December 11, aged 78, of coronary occlusion.

Horace Walton McKim, La Belle, Mo.; College of Physicians and Surgeons, Keokuk, Iowa, 1887; died in the Blessing Hospital, Quincy, Ill., December 12, aged 79, of chronic interstitial nephritis.

Ransley Jacob Miller @ Topeka, Kan.; Kansas Medical College, Medical Department of Washburn College, Topeka, 1913; served in France and Germany during World War I; served as acting health officer of Topeka; city physician; died in Christ's Hospital December 16, aged 55, of coronary occlusion.

Verlando Ziegler Miller, Brookville, Ohio; Starling Medical College, Columbus, 1896; died December 23, aged 83, of senility and coronary occlusion.

James M. Ogle, Frisco, Texas (licensed in Texas under the Act of 1907); served as mayor of Frisco; died December 10, aged 74, of coronary occlusion.

Fermin Ralph Orella, San Francisco; Cooper Medical College, San Francisco, 1892; member of the American Medical Association; fellow of the American College of Surgeons; formerly on the staff of the French Hospital; died in St. Francis Hospital December 4, aged 76, of arteriosclerotic heart disease.

Frank Diah Peterson, Cutchogue, N. Y.; College of Physicians and Surgeons, New York, 1891; member of the American Medical Association; formerly coroner and health officer of Southold; served on the staff of the Eastern Long Island Hospital, Greenport; died December 27, aged 75, of chronic nephritis and arteriosclerosis.

Vinton Joel Rickerd, Charlotte, Mich.; Starling Medical College, Columbus, 1896; member of the American Medical Association; died December 27, aged 68, of coronary thrombosis.

George Allen Ricketts, Osceola Mills, Pa.; Jefferson Medical College of Philadelphia, 1908; member of the American Medical Association; served as president of the board of education of Osceola Mills; fellow of the American College of Physicians; chief of medical staff, State Hospital, Philipsburg; died December 6, aged 71, of cerebral embolism.

Elmo Ray Royer @ North Salem, Ind.; Physio-Medical College of Indiana, Indianapolis, 1903; served during World War I; died in the Methodist Hospital, Indianapolis, December 31, aged 69, of pericarditis and myocarditis.

William Fred Scott @ Maywood, Ill.; Rush Medical College, Chicago, 1892; formerly clinical professor of surgery at Loyola University School of Medicine, Chicago; in 1939 the members of the staff of the Oak Park Hospital, Oak Park, presented an oil portrait of him to the hospital, where for many years he was chief of staff; died January 18, aged 75, of coronary occlusion.

Walter Augustus Shaw, Springfield, Mass.; Baltimore Medical College, 1906; for many years a school physician; a member of the staff of the Wesson Memorial Hospital; died in the Springfield Hospital December 23, aged 65, of hypostatic pneumonia, decompensated heart disease and coronary sclerosis.

Ulysses S. Leroy Shirkey, Cleveland; Columbus Medical College, 1891; died January 8, aged 82, of coronary thrombosis.

Fred Alexander Snowden, Batavia, N. Y.; New York University Medical College, 1898; member of the American Medical Association; formerly coroner of Westchester County and health officer of Peekskill; head of the x-ray department of the Genesee Memorial Hospital; died January 6, aged 67, of cerebral hemorrhage.

Silas Jackson Stottlemeyer @ Anderson, Ind.; Bennett Medical College, Chicago, 1911; formerly coroner of Madison County; on the staff of St. John's Hospital, where he died January 3, aged 65, of essential hypertension and cerebral hemorrhage.

Calvin Guy Stricklin, Clarendon, Texas; Baylor University College of Medicine, Dallas, 1914; member of the American Medical Association; died in the Northwest Texas Hospital, Amarillo, December 2, aged 59, of coronary occlusion.

Evangeline Wilson Young, Framingham, Mass.; Tufts College Medical School, Boston, 1906; died December 20, aged 70, of cerebral hemorrhage.

Abraham Mason Zaring, Louisville, Ky.; Hospital College of Medicine, Louisville, 1898; died in St. Joseph Infirmary December 28, aged 74, of pneumonia and nephritis.

PUBLIC HEALTH SERVICE

Stephen Andrew DeMartini @ Senior Surgeon, U. S. Public Health Service, Cleveland; College of Physicians and Surgeons, Baltimore, 1915; captain in the medical corps of the U. S. Army during World War I, in charge of a military unit in France; served in the U. S. Public Health Service Reserve, being commissioned in 1930 to the rank of surgeon in the regular corps; in 1939 promoted to the rank of senior surgeon; for many years served for varying periods at U. S. Marine hospitals at Port Townsend, Wash., Chelsea, Mass., and Stapleton, N. Y.; on Aug. 26, 1936 transferred to the U. S. Marine Hospital in Cleveland, where he was chief of the surgical service and where he died December 23, aged 57, of coronary thrombosis.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Malpractice: Broken Steel Drill Left in Humerus to Serve as Peg.—The patient suffered a transverse comminuted fracture of the humerus of his right arm. The physician to whom he went tried unsuccessfully twice within four days to reset the fractured bone. The defendant physician, Whittaker, was then called into the case and on March 12, 1935 performed an open reduction and thereafter seems to have rendered necessary postoperative care. Some weeks later, when it appeared that there was not enough callous formation to form a union, a bone graft became necessary and was performed June 19. In performing that operation it was necessary to attach a graft taken from the plaintiff's right tibia to the severed parts of the broken bone in the arm, and Whittaker planned to accomplish this by using four ivory screws, two above the break and two below. To insert the ivory screws it was necessary to use a steel drill to bore four holes through the graft bone and into the humerus in which the screws could be set. This was accomplished as to three of the ivory screws; but in boring the fourth hole the steel drill was broken, and a portion of the drill about 1½ inches long, which extended through the graft bone and into the humerus, was allowed to remain. There was undisputed medical testimony that in so doing the physician was using his judgment in determining whether it would be better for the patient and the success of the operation to remove the broken portion of the drill or to allow it to remain in the bone and to serve the purpose of an ivory screw. Further, there was undisputed medical testimony that for the purpose of fixation of a graft bone to an injured member other means than ivory screws are used and that such practice is proper. After this last operation the patient continued under the physician's care until some five years later. The physician from time to time dressed the injured member and applied different types of slings or casts to hold the arm in place. The patient suffered from pain, and by December 1935 a small sinus developed from which pus exuded intermittently until September 1940, when the patient removed from the sinus with a pair of tweezers a piece of the broken steel drill. Three months later one of the ivory screws used in the bone graft procedure also came out from the site of the incision. Soon thereafter the plaintiff's condition improved and the pus drainage gradually subsided and then ceased. Subsequently the patient instituted action for malpractice against the physician, charging lack of proper care on the part of the physician and a lack of exercise of good judgment and professional skill in leaving the broken portion of the drill in his arm. There was no medical expert testimony adduced in support of his claims, and as the trial developed it became apparent that the claim of negligence was confined to the leaving of the broken drill in the bone. At the close of all the evidence the trial court directed a verdict in favor of the physician because there was no competent testimony to support the claim that the leaving of the drill in the bone constituted malpractice. The patient then appealed to the Supreme Court of Michigan.

The patient contended that, notwithstanding his failure at the trial to sustain his claim of malpractice on the part of the physician by the testimony of any medical witness, he was nevertheless entitled to go to the jury on the record made by his own testimony, relying on *Balance v. Dunnington*, 241 Mich. 383, 219 N. W. 329, and *LeFaive v. Assefou*, 262 Mich. 443, 247 N. W. 911. The syllabus in the *LeFaive* case read as follows:

In action for malpractice, based on surgeon's failure to remove needle after performing operation for appendicitis, it was not necessary for plaintiff to show by expert witnesses that it was not good practice to sew up incision without removing needle.

Authority will be found, said the court, in support of the proposition that under certain circumstances, such as disclosure to the mind of the layman failure to perform professional duty properly, there may be a recovery in malpractice cases notwith-

standing no expert testimony is produced in support of the claim of the patient. But, in our opinion, these holdings constitute an exception to the general rule that malpractice may ordinarily be proved only by the testimony of those skilled in the particular field in which the malpractice is charged to have occurred. Our review of the record in this case, however, brings the conclusion that this case does not fall within that exception. While the patient charges a lack of proper care and a lack of exercise of good judgment and professional skill in leaving the broken drill in his arm, he did not offer in support of this claim any expert testimony such as is required in cases of this character. Nor was any such testimony developed on the cross examination of the medical witnesses who testified for the physician. Clearly the question as to whether or not proper care and attention was given by the physician at any time after his services to the patient first began is an issue requiring expert testimony for its determination. And likewise whether the physician in using his judgment in leaving the broken piece of the drill in the patient's arm to serve in lieu of an ivory screw to hold the bone split in place was such a breach of professional duty as under the circumstances constituted malpractice could be determined only from the testimony of medical experts. But in this record there is no competent testimony of lack of proper care; and each of several experts as defendant's witnesses testified in substance that defendant's use of his judgment in leaving the broken piece of drill in plaintiff's arm to serve in lieu of an ivory screw was, under the circumstances, in accordance with the usual and ordinary practice of physicians and surgeons in the community skilled in the art of bone surgery. On this phase of the case in response to a question of the foregoing purport an orthopedic surgeon and a professor of surgery in the University of Michigan Medical School testified:

My answer to that would be, it rests entirely on the judgment of the doctor. My answer is, it was a practice which is the custom and one which is good, which was followed.

Accordingly the judgment in favor of the physician was affirmed.—*Zanzon v. Whittaker*, 17 N. W. (2d) 206 (Mich. 1945).

NATIONAL BOARD OF MEDICAL EXAMINERS: Part III. Various centers, June. Exec. Sec., Mr. E. S. Elwood, 235 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY: Oral. New York, June 13-17. Final date for filing application is March 15. Sec., Dr. Paul M. Wood, 745 Fifth Ave., Room 1503, New York 22.

AMERICAN BOARD OF DERMATOLOGY AND SYPHILOLOGY: New York, June 8-9. Final date for filing application is March 12. Sec., Dr. George M. Lewis, 66 E. 66th St., New York 21.

AMERICAN BOARD OF INTERNAL MEDICINE: Written, Oct. 15. Final date for filing application is Aug. 1. Candidates in the armed forces may take the examination at their station with the permission of their medical commanding officer. Asst. Sec., Dr. W. A. Werrell, 1301 University Ave., Madison 5, Wis.

AMERICAN BOARD OF OBSTETRICS & GYNECOLOGY: Part II. Oral. Atlantic City, June 13-19. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh 6.

AMERICAN BOARD OF OPHTHALMOLOGY: New York, June 13-16; Chicago, Oct. 4-6; and Los Angeles, January. Sec., Dr. S. Judd Beach, 56 Ivie Rd., Cape Cottage, Me.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY: Part I. Oral and Written. New Orleans, Sept. 28-29, New York, Oct. 5-6, Chicago, Oct. 12-13 and San Francisco, Oct. 19-20. Final date for filing application is August 1. Sec., Dr. G. A. Caldwell, 3501 Prytanian St., New Orleans 15.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 3-6. Sec., Dr. Dean M. Lierle, University Hospital, Iowa City, Ia.

AMERICAN BOARD OF RADIOLOGY: Oral. New York, June 3. Final date for filing application is May 1. Sec., Dr. B. R. Kiklin, 162-114 Second Ave. S.W., Rochester, Minn.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Surgical Treatment of Atrophic Rhinitis.—Eisenstadt advocates an operation in which only preserved septal cartilage is employed. The cartilage is obtained from patients on whom submucous resection has been performed and is thus free of perichondrium. The cartilage is washed in sterile saline solution and is stored in 70 per cent alcohol. The principle of the operation, as in all the previous ones, is to diminish the air space in the nose, in addition to diminishing the quantity of air entering the nose. Preserved septal cartilage may be implanted on each side of the cartilaginous and bony nasal septum without necrosis of the mucoperichondrial flaps. Patients with moderate atrophic rhinitis and those with ozena obtain immediate relief from this procedure. The results are better if, in addition to transplanting preserved septal cartilage into the septum, a rhinoplasty is performed. The associated atrophy of the upper respiratory tract is also improved by the advocated nasal operation.

Atwater System of Calculating Caloric Value of Diets. L. A. Maynard.—p. 443.

Effect of Spray Drying on Vitamin Contents of Eggs.—Denton and his associates estimated the vitamin A content of emulsified and spray dried eggs by biologic and spectrophotometric methods, the vitamin D content by a biologic method and the riboflavin by a microbiologic method. The

results indicate that no loss of these vitamins occurred during the spray drying process. Vitamin D and riboflavin are stable in the stored dried products, whereas vitamin A is lost fairly rapidly, especially at higher storage temperatures.

Vitamin C Content of Wild Greens.—Murray and Stratton point out that a number of native wild plants are useful additions to wartime diets as greens or salad plants. They report assays of the vitamin C content of a number of the commonest of these edible wild plants, the tests involving both fresh samples, those which had been placed in frozen storage for several weeks before testing and those which had been cooked. It was found that pokeweed, tall dock and curly dock contained twice as much vitamin C as spinach; poverty weed, shepherd's purse and lamb's quarter about as much as spinach; chickweed, dandelions and prickly lettuce considerably less than spinach. Loss of vitamin C in wild greens due to freezing or cooking was comparable to the loss sustained under similar conditions by cultivated greens. There was some indication that the vitamin C content was greater in plants exposed to full sunlight and in fertile, uncultivated soil.

*Infectious Hepatitis: Experimental Study of Immunity. J. W. Oliphant.—p. 1614.

Immunity in Infectious Hepatitis.—Oliphant points out that homologous serum jaundice and infectious hepatitis clinically and pathologically are indistinguishable. However, the incubation period of spontaneous infectious hepatitis is about thirty days; that of homologous serum jaundice is usually much longer. This is unexplained. The author presents studies which indicate that recovery from homologous serum jaundice results in immunity to reinoculation with serum from acute cases of infectious hepatitis or with icterogenic yellow fever vaccine, and that the immunity persists for at least twelve to eighteen months. Pooled serums from 2 patients, drawn one to three months following recovery from homologous serum jaundice, when mixed with icterogenic serum failed to protect 1 of 10 persons inoculated with this mixture.

Studies of Antigens in Infected Yolk Sacs. M. J. Shear.—p. 1671.

Neostigmine Therapy of Neuromuscular Dysfunction.—Kabat employed neostigmine therapy in a variety of types of neuromuscular dysfunction. Patients selected were those with muscle spasm, contracture, paresis or muscular pain in whom there was no evidence of psychiatric involvement and in whom the disability had existed for a considerable time. These patients had had no spontaneous exacerbations or remissions and were either not improving or improving so slowly that the effect of therapy could be evaluated. The disability was not complicated by demonstrable anatomic lesions such as ankylosis,

bony block, complete loss of innervation or active inflammation. Neostigmine was injected subcutaneously once or twice daily. The routine dose was 2 cc. of neostigmine methylsulfate 1:2,000 solution (1 mg.) together with atropine sulfate $\frac{1}{100}$ grain (0.65 mg.) or $\frac{1}{50}$ grain (0.43 mg.). The atropine was used to eliminate the unpleasant parasympathetic side effects of the neostigmine. Observations on 53 patients under this treatment revealed that improvement in range of motion, relief from pain and increase in strength and endurance may occur rapidly in cases of disability following trauma of hemiplegia and related neurologic conditions and of chronic rheumatoid arthritis and subacromial bursitis. The results have been encouraging enough to warrant further investigation. The mechanism of action of neostigmine in relaxation of muscle spasm or contracture, in relief of muscle, joint or nerve pain and in increasing the power of voluntary contraction of paretic muscles is not established. The inhibitory action of neostigmine on cholinesterase at the synapses in the central nervous system, as well as at the myoneural junction, may be of importance: Since the action of neostigmine on the central nervous system in man is inhibition of muscle tonus and the deep reflexes, it appears likely that the relaxation of muscle spasm is a manifestation of the central action of the drug. Such a central inhibitory action on muscular hypertonus is apparently effective regardless of whether the hypertonus is of peripheral origin, as in cases of trauma or arthritis, or of central origin, as in poliomyelitis and hemiplegia.

Urticaria Due to Inhalant Substances: Phenomenon Rarely Appreciated. V. J. Derbes and H. T. Engelhardt.—p. 729.

Urticaria Due to Inhalants.—Derbes and Engelhardt report 2 cases in which urticaria resulted from inhalant substances. 1. A woman aged 42 had ragweed hay fever for six years. After the ragweed pollen had been in the air for a week or ten days; urticarial wheals began to appear. These were first noticed as erythematous areas on the face, and later diffuse edema of the face and generalized hives became manifest. These hives persisted throughout the ragweed season every year. This year, when the hay fever was adequately controlled by pre-seasonal treatment, the patient remained free also from urticaria. Every one who has administered various therapeutic extracts in desensitizing allergic patients recognizes that systemic reactions characterized by urticaria are by no means rare. 2. A boy aged 11 had ragweed asthma for three years. During this period exposure to the fumes of fresh paint invariably produced an attack of asthma associated with urticaria. The onset of both is within fifteen or thirty minutes after exposure. It is of interest that whereas the attacks of asthma are over within twenty-four hours, the urticaria persists three or four days after this momentary stimulus. Cases in which inhalant substances are the cause of urticaria are common and many more of them would be discovered if this mechanism was borne in mind in attempting to diagnose chronic urticaria. Sulzberger lists feathers, pollens, animal danders,orris root insecticides and sprays, ephedrine and other nasal sprays as well as various dusts and dyed materials of all descriptions as common inhalant causes of urticaria.

Cold Hemagglutination Test in Primary Atypical Pneumonia.—Humphrey studied the reaction to the cold autohemagglutination test by 14 patients diagnosed as having primary atypical pneumonia. Of the 14 all but 1, or 93 per cent, showed positive reactions. No strong reaction was noted in a series of 80 controls who were largely patients with upper respiratory and pulmonic diseases. The first positive reactions were noted within four to eight days of the onset, but in instances the reaction might be delayed until the early part of the third week. The maximum titer usually occurred between the sixteenth and twenty-third days of illness and with but rare exception became weak or negative between the thirty-fifth and forty-fifth days. Clinically there was little relationship between the titer and the fever, although some parallelism existed between the test and the sedimentation rate and the x-ray findings. While the x-ray examination is often confirmatory, other laboratory aids, such as the sedimentation rate and leukocyte count, have proved to be of little value in the diagnosis. It seems probable that the only procedure with any degree of specificity for the disease may be the cold autohemagglutination test. A disadvantage is the fact that the test is not consistently positive in the first week of the illness. However, most of the agglutination reactions for other diseases are positive no earlier.

Shigella Group of Enteric Bacilli.—An organism that is a nonmotile, gram negative, non-spore forming rod, fails to produce hydrogen sulfide, does not utilize citrate or liquefy gelatin, does not produce acetylmethylcarbinol or hydrolyze urea and ferments glucose without gas formation (with two exceptions) but fails to ferment salicin may be suspected of belonging to the Shigella group. There are three major points of differentiation between the Shigellas and the Salmonellas. The Shigellas are nonmotile, do not produce hydrogen sulfide and fail to form gas, whereas the majority of species of the Salmonellas are actively motile, produce large amounts of hydrogen sulfide and form large amounts of gas in the carbohydrate mediums. The lines of demarcation are not so sharp between the Shigellas and certain anaerogenic species of the paracolon and proteus groups. The present trend is to discard the older terms *Bacillus dysenteriae*, *Bacillus paradysenteriae* and the like for the more correct generic designation of Shigella, together with the type specific names. The genus Shigella comprises 20 species of medical importance that are fairly well differentiated by biochemical and serologic means; in addition there is a heterogeneous group formerly known as *Bacillus* dispar that has not been studied sufficiently to permit a species differentiation. The Shigella organisms enter the body through the ingestion of food or drink contaminated by the feces of patients or carriers. Nearly 3 per cent of convalescent carriers may excrete the organisms for more than three months. A

significant percentage of convalescent carriers may remain dangerous for a year. In acute dysentery stool cultures will usually yield the causative organisms, provided the specimens are obtained early in the disease and are subjected to laboratory examination within a short time after passage. In carrier surveys or in chronic conditions the rectal swab specimen is to be preferred. The specimen should be cultured on S-S (Salmonella-Shigella) agar plates. The most effective means of serologic diagnosis is through the use of absorbed, type specific antisera for their reactions on pure cultures isolated from fecal specimens. Efforts should be made to detect and isolate individuals excreting the organisms. The evidence incriminating flies in dissemination renders their control imperative. The prophylactic use of vaccines has been hampered by the lack of adequate data on the distribution of the various types of Shigella throughout the world, but recent developments have rendered the specific diagnosis of shigellosis relatively simple. It is possible that the prophylactic use of the sulfonamides may prove to be of value in control measures.

Burns Treated in Overseas Army General Hospital.—Rawles and Massie list as fundamentals in the treatment of burns (a) the prevention and control of shock, (b) the relief of pain, (c) the prevention and control of infection and (d) the prevention of contracture and excessive scarring by proper splinting and early skin grafting. The local surface treatment should be limited to a minimum amount of débridement and cleansing and, finally, the burned area should be covered with sterile petrolatum or, if this is not available, with boric acid ointment. A firm pressure dressing should be applied over this, which should not be changed for ten to fourteen days unless complications arise. The authors review observations on 78 patients with burns. Forty-two of the patients were grafted, a total of 63 operations being done. The preparation of third degree burned areas for grafting was often a real problem when much secondary infection was present. Dressings wet with isotonic solution of sodium chloride with fine mesh gauze next to the granulating wounds were applied on admission in nearly all cases, since an average time of thirty days had elapsed in those cases in which grafting was necessary. Slough was removed by sharp dissection if necessary. The skin around the wounds became macerated from the moisture, and since it had been felt that the dead debris probably acted as a culture medium this was cleaned away with neutral soap and water. All patients were given a high protein diet, multivitamins and iron. A patient was not considered ready for skin grafting unless the plasma proteins were above 6.5 Gm. per hundred cubic centimeters and the red blood cell count was 4,000,000 or above. Fifteen of the 39 patients grafted received blood or blood plasma to bring their readings above the minimal levels. Split grafts are the best type from the standpoint of preventing further scar tissue and for furnishing a durable skin surface. They were used in 54 of the 63 operations. Pinch grafts were used in the other 9. In a few of the extensive wounds in which it was difficult to cut enough split grafts, pinch grafts were used to fill in gaps. Grafts were sutured in place with a slight overlap at the edges with a continuous suture of fine silk. Fine mesh gauze impregnated with an ointment was placed next to the grafts. Sterile gauze and mechanics' waste was next applied and an Ace bandage for pressure. In the case of extensive burns in which almost an entire extremity had to be grafted the percentage of takes was from 95 to 100. Poor results were obtained in the cases with relatively small granulating wounds which had been neglected because they were small, with the hope that they would heal over without grafting. As a result, scar tissue formed in the bed, which often did not prove to be a fertile field. This should bring home the necessity of covering the smallest of granulating wounds with epithelium.

Perforated Peptic Ulcer.—Illingworth and his associates obtained records of all perforations treated in hospitals of over 15 beds in the West of Scotland and in private practice during the year 1943. From 1924 to 1938 there was a progressive increase in the incidence of perforations. During the war the steady increase has been interrupted by a great rise in 1940-1941 followed by a return to a lower level. These changes almost entirely concern duodenal ulcer. The 1940-1941 rise was not correlated with air raids in this part of the country. It is suggested that, in addition to anxiety about the war situation, overwork and perhaps undernutrition may have exerted an influence. The sex ratio has undergone little change during the twenty year period. The rise in 1940-1941 and the fall in 1941-1942 were confined to men. Perforation is rare in childhood; its incidence rises rapidly in adolescence and attains a maximum between the ages of 30 and 40 years. Perforations are unduly common in December and relatively uncommon in August, September and October. This low incidence in the summer months may possibly have a nutritional basis or may be related to the holiday season. Perforations are less frequent on Sundays and Mondays than on other days. This may be related to rest at the week end. Perforations are unduly common between 3 p. m. and 6 p. m. and comparatively uncommon during the night and morning. There may be a correlation with periods of stress and rest respectively. The fatality rate from perforations increases with age and with delay in treatment. It is greater in gastric than in duodenal ulcer, in females than in males, in winter than in summer.

*Appendicitis in Its Relation to Pregnancy. B. Johnson.—p. 379.

Bronchitis.—Steel studied 500 histories from records in which a diagnosis of chronic bronchitis was made. The only selection in this series was to exclude patients suffering from active pulmonary tuberculosis and from primary myocardial degeneration. All patients presented themselves with the symptoms of cough, varying in duration from five weeks to fifty years, or of cough and sputum, or of frequent "colds" in the head and chest, or of cough with shortness of breath, or of "asthma." During acute exacerbations the findings resemble those of acute bronchitis, with or without pyrexia, increased

sputum and increased rales and rhonchi. An acute exacerbation, especially in the adult, may run an afebrile course. Of 100 patients in the hospital only 23 were febrile on their admission, and 7 were slightly febrile. The remaining 70 patients were afebrile. In observations on the aforementioned 500 patients and on the 100 patients in the hospital, no etiologic agent has been isolated. The organisms found in the sputum and in the material from bronchoscopic suction were those which normally inhabit the nasopharynx. It is highly probable that the causative agent is intimately associated, if not identical, with the virus of the common cold. The organisms found in the sputum are secondary invaders. Diseased tonsils and adenoids should be removed from children irrespective of age. Abrupt temperature changes precipitate acute exacerbations throughout the year. The "hardening process" advocated by many fathers of bronchitic children has a number of dangers. Clinical impressions from the use of vaccines indicate their value when given in small weekly doses and sufficient to produce only a local reaction.

Appendicitis and Pregnancy.—The incidence of appendicitis in women is not influenced by pregnancy, Johnson says. Primary acute appendicitis occurs at the same rate in all women irrespective of whether a pregnancy is present or not. Although primary acute attacks of appendicitis are rare in pregnancy, an existing chronic appendicitis is unfavorably influenced by it. The course of acute appendicitis during pregnancy is rapid and perforation may occur within a few hours, especially in the later months. Diagnosis becomes increasingly difficult after the sixth month. When doubt exists, operation should be performed if the patient's general condition is grave. With early operation the maternal prognosis is good, but if perforation has occurred a mortality rate of 50 per cent must be expected. There is little danger of abortion in simple cases, but after perforation 50 per cent of uteri will empty themselves, thus increasing the mortality by 5 per cent. In the last two months perforation is extremely dangerous both to mother and to child. Cesarean section followed by appendectomy is advocated as the procedure most likely to give good results. The type of cesarean section depends on the extent of involvement of the parietal and uterine peritoneum. If involvement is very severe, Porro's operation is safest. In most other cases the lower segment operation will be best. Whenever possible the diseased appendix should be removed if there is a possibility of the occurrence of pregnancy.

*Treatment for Raynaud's Disease with 2-Benzyl-4,5 Imidazoline (Prisol Ciba). T. Lindquist.—p. 83.

Treatment of Scarlet Fever With Sulfanilamide, Specific Serum and Horse Serum.—Of 1,347 patients with acute, uncomplicated scarlet fever admitted to the Blegdam hospital during 1940, 318 were treated with sulfanilamide, 295 with anti-scarlet fever streptococcus serum and 118 with normal horse serum. The control group of 616 patients did not receive treatment. Sulfanilamide was employed by Neukirch and his associates, patients up to the ages of 4 years receiving 0.3 Gm. four times, those from 4 to 14 years 0.6 Gm. four times and those over 14 years 0.9 Gm. four times for eight days. Sulfanilamide had a definite effect in preventing complications, especially of the type considered bacterial, such as otitis and its late sequel mastoiditis. The incidence of these two complications was 3.8 and 1.2 respectively as compared with the control group, in which it was 8.8 and 3.2 respectively. Adenitis was reduced by a third, as was arthralgia; the incidence of peritonsillar abscess was reduced by three fourths and recurrences by about one third. Sinusitis and nephritis were only slightly influenced, and there was no effect on myocarditis. The drug had little or no effect on complications in the low age group (0 to 3 years). Sulfanilamide treatment as a routine is recommended as follows:

The full dose employed by the authors is to be given during the first week and continued with half the dose for the next two weeks. The total dosage of sulfanilamide would therefore be about 20 Gm., 40 Gm. and 60 Gm. respectively in the age groups 0 to 3, 4 to 14 and over 14 years. Compared with the complications of the control group, those occurring in the sulfanilamide treated patients were delayed and in many cases appeared only when the sulfanilamide must be presumed to have been excreted. It seems likely that continued treatment would have the effect of reducing the complications still further, although untoward reactions may likewise be increased, since a larger number of patients may be sensitized. In the authors' cases these reactions were less frequent than those from serum treatment; they were less severe and less painful. Vomiting was observed in 23 cases (7.2 per cent). There was a rash in 41 cases (12.9 per cent) but never in the age group from 0 to 3 years, which comprised 65 patients. More serious reactions, such as leukopenia, severe hemolytic anemia and anuria, were not observed. Anti-scarlet fever streptococcus serum had no definite effect in preventing complications. Normal horse serum seemed to be ineffective. The clinical picture of this scarlet fever epidemic revealed that there may be a direct relationship between the toxicity of the initial phase and the incidence of complications, whereas there was no correlation between the incidence of complications and the degree of eruption and desquamation.

Causes of Xerostomia.—Faber reports 49 cases with reduced salivary secretion. In only one third of these could a definite diagnosis be easily made of the causes of reduced secretion. These were cases of diseases of the salivary glands, such as congenital aplasia of the parotid glands, epidemic parotitis, lymphogranuloma benigna and Mikulicz's syndrome. Roentgen treatment was the cause of decreased salivary secretion in 2 cases. In the rest it was possible to determine the cause of xerostomia in one half; these were cases of pernicious anemia, of sideropenic anemia and of ariboflavinosis. In some of the "idiopathic" cases a chronic inflammation was considered as maintaining a previously developed xerostomia. In the rest no cause could be given, but it is suggested that the reduced salivary secretion may depend on the endocrine glands, particularly at the time of the climacteric. In a rather large number of cases fissures in the corners of the mouth, atrophy of the mucous membrane of the tongue and pain in the tongue were found to be sequels of reduced salivary secretion.

Benzyl-Imidazoline in the Treatment of Raynaud's Disease.—Lindquist reports his experience with 2-benzyl-4,5 imidazoline hydrochloride in the treatment of 12 cases of Raynaud's disease of medium severity. Improvement in all cases was obtained from oral administration of the drug; 6 of the patients had no complaints, 3 had very little complaints and the condition of 3 additional patients was improved slightly. Untoward reactions such as vertigo and slight chills were of no importance. In 1 of the cases a dermatitis developed on the hands and feet. The eruption resembled that after prolonged histamine iontophoresis. The effect of benzyl-imidazoline was recorded by ascertaining the changes in the skin temperature at the finger tips. The patients remained at a room temperature of or slightly below 59 F. after their hands had been immersed in water of 59 F. A pronounced vasodilator effect was demonstrated on the hands of the patients to whom the drug was administered orally or intramuscularly before their hands had been immersed in the water, as compared with the hands of the controls. Treatment consisted in peroral administration of one tablet (0.025 Gm.) of the drug three times daily for several weeks. In some of the cases two tablets (0.050 Gm.) were given three times daily, and in addition a 10 per cent benzyl-imidazoline ointment was applied to the hands. There was no recurrence of the condition in some of the cases when the treatment was discontinued after the administration of forty tablets. Definite improvement in the blood perfusion of the fingers was obtained with the drug in an additional thirteenth case in which bilateral surgical removal of the inferior cervical ganglion, of the two superior thoracic ganglia and of the in-between portion of the sympathetic nerve had been performed some time before. The vasodilator effect in this case suggests that the blood vessels may be affected directly by the drug or through the sensory nerves.

Book Notices

Medical Uses of Soap: A Symposium. By G. Thomas Halberstadt, P.S., Ch.E., and others. Edited by Morris Fishbein, M.D. Fabrikoid. Price, \$3. Pp. 182, with 41 illustrations. Philadelphia, London & Montreal: J. B. Lippincott Company, 1945.

This is a collection of uniformly excellent articles which tell the story of soap—its use and abuse, its chemistry and manufacture, its effects on normal and diseased skin, on the hair, for shaving, in industry—indeed the material goes well beyond the confines "Medical Uses of Soap." The symposium presents the views and experiences of men in the varied fields of dermatology, chemistry, bacteriology and industrial medicine, so that there is some duplication of material with occasional differences of opinion, but the result is a practical consideration of the subject.

The opening chapter on soap technology considers the chemical and physical properties of all types of soaps: toilet bars, household soaps, even the newer soapless detergents. The next four chapters deal with the use of soap on skin and hair. Consideration is given to the effect of soap on normal and diseased skin and to those diseases for which soap is indicated or contraindicated. The section which considers soaps for industry and the industrial worker is also very practical and thoroughly covers the whole field—skin inurement, patch tests, soap formulas, hygiene of workers—and includes a recital of illustrative case histories. There is an interesting discussion on soap for shaving in which the formulas of the various types of shaving soaps are furnished, and here too there is a section devoted to the use of shaving soap in the presence of certain skin diseases. A decalogue of fallacies answers some of the questions occasionally asked by patients. A section on cutaneous detergents other than soaps brings the subject up to date. This chapter discusses the various soap substitutes that have recently been introduced, the formulas, reasons for being, their advantages and disadvantages, their present status, and closes with the statement that "clinical experience up to now indicates that these detergents will be more widely used when a low cost cake form is developed which will lather and which has satisfactory physical properties." The final chapter deals in a general way with the medical uses of soap, as in first aid; venereal diseases and hygiene. The clinical chapters are illustrated in black and white, and there is a full index. Altogether the book is an excellent presentation that the physician should find not only interesting but useful.

A New Principle in the Treatment of Poliomyelitis. By Otto Meyer. Vol. A44-P, International Bulletin for Medical Research and Public Hygiene. Editor-in-Chief: W. L. Colze. Paper. Pp. 11. New York, Brussels & London: International Bulletin, 1944.

This short monograph is bad enough to warrant serious condemnation, although it is almost unthinkable that any intelligent physician could be influenced by it. The author builds up the theory that poliomyelitis is a streptococcal infection; that streptococcal infections cause latent jugular phlebitis, which in turn causes increased spinal fluid pressure, which in turn causes symptoms of meningeal irritation and paralysis. All this can be prevented by the simple expedient of the application of three or four leeches over each jugular vein! The final plea of the author is that this method does not "conflict with any other treatment."

Gynecological and Obstetrical Urology. By Houston S. Everett, A.B., A.M., M.D., Associate Professor of Gynecology, the Johns Hopkins University, Baltimore. Cloth. Price, \$6. Pp. 517, with 220 illustrations. Baltimore: Williams & Wilkins Company, 1944.

This book, as its title implies, deals only with urology in women. The classification of the text is good, the subject and the chapters are well arranged and the many illustrations are excellent. This is especially true of the anatomic drawings. The book is easy to read, and at the end of each of the twenty-three chapters is a comprehensive bibliography. The book begins with a discussion of the anatomy and the physiology of the urinary organs, followed by a chapter on the relationship of urology to allied specialties. There are two chapters devoted to the various procedures in urologic examinations in which,

in our opinion, too much detail on cystoscopic technic is given and not enough space devoted to a discussion of the physiologic principles of excretory urography, which is an important subject in a book of this kind. The remaining eighteen chapters deal with various urologic diseases. It would seem that more space should have been given to pyelitis of pregnancy. On the other hand, three chapters are devoted to ureteral obstructions, of which ureteral stricture is discussed in great detail. The frequency of this condition is still a debatable subject among urologists. Although it is questionable whether anything of importance has been brought out in this book that is not included in any good general book on urology, the book can be recommended because of the completeness with which it has handled some of the urologic diseases that are common to women.

Malaria: Its Diagnosis, Treatment and Prophylaxis. By William N. Bispham, Colonel, U. S. Army, Retired. Cloth. Price, \$3.50. Pp. 197, with 5 plates. Baltimore: Williams & Wilkins Company, 1944.

With great numbers of the armed forces in tropical and semi-tropical areas and many chances to contract tropical diseases, it is important that the practitioner should be informed of the present status of one of the most important of these diseases. Dr. Bispham has done this by presenting the picture of malaria so that the practitioner will have a thorough, practical knowledge of the disease. The author's complete description in the chapters on pathology, symptomatology and treatment give a picture of the disease of its most recent advances up to the present time. Dr. Bispham has made use of the leading authorities to review many sections of the book and has also included an interesting chapter on the prevention and treatment of malaria in West Africa in recent years by Comdr. L. T. Coggeshall (MC), U.S.N.R. The volume is highly recommended to students, malariologists and practitioners.

Essentials of Pharmacology and Materia Medica for Nurses. By Albert J. Gilbert, M.D., Instructor of Pharmacology, Aultman School of Nursing, Canton, Ohio, and Selma Moody, R.N., Instructor in Nursing Arts, The Presbyterian Hospital of the City of Chicago. Second edition. Cloth. Price, \$2.50. Pp. 290, with 20 illustrations. St. Louis: C. V. Mosby Company, 1944.

According to the preface of the first edition, "the object of this little volume is to present the facts and theories of pharmacology and materia medica for nurses in a lucid, concise form, adapted to the limited time available for the course in many nursing schools. . . . Where the larger texts are used, this book may be helpful in reviewing pharmacology and materia medica." There are available a number of books intended for the nursing profession; some of them are unnecessarily complete, others are too brief and sometimes inaccurate. The authors of most of the books, however, apparently realize that the object in teaching pharmacology and materia medica for nurses is to provide information on how the drugs are used and what they may be expected to do; not to provide a book so complete in details that the nurse is receiving as thorough instruction as the medical student. Where to draw the line is a difficult decision in some instances, but the present book seems sufficiently brief to be not objectionable to the student nurse and yet sufficiently complete to provide necessary information, especially when the authors' warning concerning the concurrent use of textbooks is heeded. A few questionable statements appear, but the general conservative presentation compensates for such faults. One does wonder however if it is necessary to devote in a book of this sort fifteen pages to arithmetical problems. Particular emphasis is placed on official and new and nonofficial drugs, but some of the newer generally recognized drugs such as sulfamerazine and sulfapyrazine are not mentioned. The index seems adequate.

The Recording of Sickness Absence in Industry (A Preliminary Report). By a Sub-Committee of the Industrial Health Research Board. Medical Research Council, Industrial Health Research Board Report No. 83. Paper. Price. 4d Pp. 17. London: His Majesty's Stationery Office, 1944.

The Industrial Health Research Board, in recognition of the need for adequate industrial medical records, has issued these instructions for recording sickness absenteeism. All necessary forms and descriptions of procedure for entering and calculating statistical data are included. It performs for Great Britain what has been instituted in this country by the Division of Industrial Hygiene in the United States Public Health Service.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

SMALL STATURE OF THIRTEEN YEAR OLD GIRL

To the Editor:—A girl aged 13, 4 feet 8½ inches (143 cm.) tall and weighing 109 pounds (49 Kg.) is embarrassed at her small stature; in the last year she has not grown at all. She has normal pubic and axillary hair growths; her breasts are rather well developed; she has been menstruating for two years. Her parents are 5 feet 3 inches (160 cm.) tall and their parents were not much taller, although some of the child's uncles and aunts are tall. Do you feel that any medication is indicated?

Morris B. Schwartzfarb, M.D., Bronx, N. Y.

ANSWER.—It is probable that this girl is far enough along in adolescent development so that the epiphyses and diaphyses of the long bones have united and that further growth in height will not occur. Under such circumstances as described it is important that a simple x-ray film of the femur be made so that the epiphyses at either end can be seen: if the epiphyseal line shows that union is not yet complete, further growth may be achieved; if these epiphyses are united, no further growth is possible.

In case the epiphyses are found open and it is considered desirable to stimulate growth, it is important to look into the nutritional background and be certain that it is adequate in every way. The presence of chronic disease should be eliminated. Then the decision must be made as to whether the patient is clinically deficient in thyroid and if so this deficiency made up. Barring these three possibilities, there remains the attempt to stimulate growth with anterior pituitary extract. There is still some doubt as to the efficacy of pituitary derivatives, but clinical trials of special extracts, standardized by the manufacturers in their capacities to stimulate the growth of experimental animals, might be worth while. Such material is introduced hypodermically and must be used daily for really effective results; the achievement of growth could not be demonstrated in less than three months—perhaps in not less than six to twelve months.

VALVULAR MURMURS IN RHEUMATIC HEART DISEASE

To the Editor:—In a large percentage of patients with early rheumatic fever at this center a soft blowing systolic murmur is heard only at the third and fourth left interspaces just to the left of the sternum; or the murmur may be heard over the entire precordium but is heard best at the third and fourth left interspaces just to the left of the sternum. What valve or valves are involved, and what is the pathologic condition?

Noah N. Feldman, Lieut. Comdr. (MC), U.S.N.R.

ANSWER.—Soft blowing systolic murmurs heard only or heard best at the third and fourth left interspaces just to the left of the sternum are present in normal persons as well as in patients suffering from rheumatic fever (types 2 and 3 of Paul). The significance of such murmurs is extremely difficult to evaluate. The mechanism of the production of such murmurs in normal persons has never been satisfactorily explained. In patients suffering from rheumatic fever, the presence of such murmurs has been explained by an early lesion of the aortic valve (Hamilton and Thomson). Such murmurs are to be distinguished from high pitched, occasionally harsh systolic murmurs heard over the midprecordium, with maximum intensity in the region of the apex of the heart (type 1 of Paul). These are frequently found in patients suffering from active rheumatic carditis. The usual pathologic explanation for the latter variety is a dilatation of the mitral ring due to myocarditis, associated with roughening of the edges and commissures of the mitral valve.

The important point about systolic murmurs in the diagnosis of rheumatic fever is that alone they are an unreliable means for such diagnosis. On the other hand diastolic murmurs, i. e. a short early blowing murmur heard best over the second right interspace, over the sternum or over the third or fourth left interspaces, or a low pitched rumbling crescendo murmur followed by an accentuated first sound at the apex are highly significant in the diagnosis of rheumatic heart disease. Systolic murmurs are apt to be more significant when they change from day to day and are particularly significant when they appear during the course of rheumatic fever and were known not to have been present prior to that event. Thus the changing

character of the murmur, its harshness and its high pitched character, with maximum intensity in the region of the apex, tend toward a diagnosis of an organic lesion.

The relationship between the importance of a systolic murmur in the diagnosis of rheumatic fever and other symptoms and signs was well summarized by T. Duckett Jones in *The Journal*, Oct. 21, 1944, page 481. In that paper Dr. Jones stressed the difficulty of the diagnosis of rheumatic fever and separated the major criteria for diagnosis from minor criteria. One of his major criteria is carditis as determined by cardiac enlargement, significant murmurs, i. e. diastolic murmurs or apical high pitched systolic murmurs, pericarditis or the presence of congestive heart failure. In general symptoms and signs other than the type of murmur described in the question must be present to establish a diagnosis of rheumatic fever or rheumatic heart disease, since such murmurs are so often found in normal persons.

BRONCHIAL ASTHMA AND TESTOSTERONE

To the Editor:—I am advised that testosterone has been used in the treatment of asthma of unknown cause with excellent results. Will you kindly advise me regarding this form of treatment?

Elmer W. Clarke, M.D., Norton, Mass.

ANSWER.—Although in many persons there is a relationship between the endocrine system and bronchial asthma, little benefit has resulted from the use of glandular products. References to the use of testosterone in the treatment of bronchial asthma have been meager. Two successful reports follow, but experience is so limited that optimism is not warranted:

The Cleveland Clinic (Allergy in Clinical Practice, Philadelphia, J. B. Lippincott Company, 1941, pp. 297-298) reports that a man aged 46 with sexual impotence had suffered from bronchial asthma for two years despite treatment. He then received testosterone propionate in 25 mg. doses three times weekly for the impotence: the asthma disappeared completely, except for an occasional "wheeze," and the potency returned to normal. The efficacy of the male sex hormone in controlling the asthma was demonstrated repeatedly: withdrawal of the therapy for as little as ten days resulted in a recurrence of the asthma, and three weeks without treatment terminated in severe asthma. When the patient was requested to have a complete allergic investigation he refused because his symptoms were controlled by androgen therapy.

La Fitte and Guttières reported (*Bull. méd.*, Paris 54:284 [June 8] 1940) that a girl aged 19 years had suffered from severe asthmatic crises for six years. The asthma first appeared at the age of 3 years, was mild and disappeared after several months, not to reappear till the onset of menstruation at 13 years of age. Then she had severe asthmatic attacks always about eight hours before the onset of the menstrual flow. The menstruation was very painful, irregular and excessive in amount. No associated premenstrual breast pain or engorgement was experienced. No treatment had helped the asthma. Examination revealed no endocrine or genital abnormality; her general health was excellent. The authors tried testosterone, postulating a hyperfollicular syndrome: they gave five intramuscular injections of testosterone acetate without any other treatment. The asthma ceased, and she was given three monthly series of five injections each, from twelve to twenty days following menstruation, after which she had no asthmatic attacks and her menstrual periods became regular and painless. For the past six months, in spite of being without further treatment, she has been free from asthma and menstrual abnormalities.

AMMONIA AND THE NERVOUS SYSTEM

To the Editor:—I have 3 patients who were overcome with ammonia gas or fumes while at work; 3 of their companions died from the effect. The 3 who survived have eye injuries and pains in the abdomen; the most prominent symptom in all seems to be intense nervousness and hysterical excitement. Exposure occurred on Aug. 31, 1944, when the connection of a car of ammonia was broken while unloading. What are the pathologic effects of ammonia on the nervous system?

S. Ross Jones, M.D., Port Arthur, Texas.

ANSWER.—Ammonia is not considered to have a direct action on the central nervous system. The present condition of these patients is probably a neurologic and psychologic response to the tissue damage produced by the original acute exposure to ammonia gas and to the serious results of the original episode on their companions and themselves.

EPOCHS IN MEDICINE

THE IMPROVEMENT OF MEDICAL SERVICE TO LABOR

ERNEST E. IRONS, M.D.
CHICAGO

In the years previous to our present world war most of us were none too clear as to the changes in social and economic thinking that were insidiously creeping upon us. The stupendous war effort after Pearl Harbor, about which most of our daily activities now revolve, has still further diverted attention from the social and economic trends, which have been accelerated by the dislocations and modifications in living incident to the war. Some of these trends if properly guided will lead to salutary results for the nation; others if relegated to the hands of the ignorant may destroy the fruits of decades of effort. The real significance of still others is not immediately apparent without the aid of some perspective.

We can, however, get some notion of what the future has in store by looking back at the epochs of history, economic, social and medical. There we find almost exact parallels of many of our present problems, and from the experience of our forebears we can profit in the charting of our course.

Understanding of the epochs in medicine may be helpful in medical planning for our postwar period, especially with reference to the relations of medicine and labor.

The recent victories of medicine over disease in fields of infections and in surgery are deeply satisfying when compared in retrospect with what was possible in the prevention and cure of illnesses thirty years ago. Compared to the vast number of unsolved problems of disease, however, these victories are but local skirmishes in an age old battle and should serve only to stimulate and direct future effort. Nor are the problems of medicine limited to those of former years; there have been added those that have come as a result of alterations in the methods and weapons of war, and of the economic and social changes of peace.

Consecutive epochs of medicine cannot be clearly defined, but each shades into its successor as new knowledge has amplified and modified the conclusions drawn from previously known facts. The medicine of Hippocrates and Galen was a combination of limited observations and metaphysical reasoning, which allowed slow progress; it led to some sound and also to some queer conclusions and became stagnant under the domination of tradition and authority. The growth of anatomy, pathology and physiology in the seventeenth and eighteenth centuries slowly corrected false beliefs, and in the nineteenth century the beginnings of biochemistry and bacteriology made medicine more

rational and scientific. On this foundation of centuries the marvelously rapid progress thus far in the twentieth century was achieved.

These epochs of medicine are inextricably interwoven with those of the political and economic history of nations and follow a similar pattern. The events of one period carry over and condition those of succeeding periods. The aggrandizement of the rich at the expense of the poor laid the foundations for the French Revolution, which in turn went far beyond a reasonable correction of ills, by destruction of property and loss of valuable lives. Many of the abuses remained uncorrected and contributed to the unstable social and political conditions during the Napoleonic wars.

In England in the eighteenth century the introduction of mechanical devices and use of water and steam power in manufacturing together with new methods of transportation led to the collection of people in larger groups in cities and created new economic and social problems in collective living and likewise, though largely unrecognized at the time, new medical problems. The increased incidence of rickets was the result of living indoors in crowded tenement areas with the smoke of industry obscuring such sunlight as was available.

Much the same kinds of factors became operative here in our own political, economic and medical evolution of the nineteenth century. With respect to the general public welfare, they have been at once curative and disease producing. The intense industrialization of cities of the twentieth century has made possible our amazingly successful war effort but at the same time has accentuated the economic and social ills from which we were already suffering. The acute congestion in new war plant areas with housing shortages and ill provided and shifting populations has been met by some temporary expedients, which are acceptable in the absence of better and safer measures but cannot continue after the war. Nor will they be necessary, because to a large extent these populations will have gone elsewhere.

There remains with us the medical problem of proper care of all the people; who stem from many races and nationalities, some of which are still incompletely assimilated. This problem is intimately connected with our economic and social life. Medical inadequacies in many regions are coincident with and often are directly traceable to economic deficiencies. The cure of the medical defect can be accomplished only by simultaneous improvement of social conditions. Medicine can and will do much to help but cannot do it all.

Under our present system of medical free enterprise the steady growth in efficiency of medicine in the prevention and cure of disease is continuing from year to year. In large cities and congested areas, slum clearance and improved housing need medical cooperation but are primarily economic and social problems. Many rural areas receive insufficient medical care. The

remedy will no doubt include new hospital and diagnostic centers to be established under local, county and state control and if necessary the voluntary location of qualified physicians on temporary or partial but adequate salaries paid by governmental and other agencies. The populations themselves in such areas will require education as to their own needs as well as to the availability of the new facilities. Better distribution of physicians to these poor, backward or sparsely populated areas will be practicable under any plan only when it is made possible for the doctor to live and raise his family in reasonable comfort, with some cultural advantages for his children.

Voluntary insurance plans, including those sponsored by local groups, medical societies, hospital associations and large insurance companies, are growing daily in numbers and coverage, so that millions of workers are given protection against the hazards of illness. These measures of social and medical care are developing in an orderly way at an ever increasing tempo, with the elimination of unsound features as experience accumulates.

There are now those who sometimes with sincere intent but often actuated by political motives would revolutionize medical practice and thereby destroy standards which have already demonstrated their worth in giving this country the highest quality of medical care in the world. In place of a sound and progressive program, the advocates of socialized medicine urge that there be substituted a system of government enforced provision for medical care supported by a tax of 1.5 per cent on payrolls of the employer and 1.5 per cent more of the first \$3,000 deducted from the pay check of the worker, directed by a central bureau headed by the Surgeon General of the Public Health Service and served by doctors to be employed by the government and by hospitals selected by the government. This plan envisages the establishment of a bureaucracy far greater than any other in our government and presents also vast political possibilities. Such plans stifle initiative in the physician and at the same time reduce the level of quality of service for all. When such criticisms are made to advocates of government controlled medicine they reply that failure of their experiment, which involves the lives and welfare of one hundred million people and an annual expenditure of almost two billion dollars, is insignificant because they can then change it.

Says one of their spokesmen¹ "Distribution of medicine has always been faulty. The war has only brought it into sharp relief by the dislocation of populations, which has made it evident to us that our present system of distribution cannot be carried on. It has also shown us that local control is not satisfactory. The condition is particularly imminent at this moment and favorable to a change, because we shall also have to allocate and place in various parts of the country where they are most needed the medical officers who will return from the Army." And so they plan to ration by bureaucratic order the sixty thousand doctors on their return from fighting on foreign soil for the freedom of their homeland.

And "anyway," they say, "medicine must be entirely reorganized along new lines" and "cannot be left under the old patterns." This is the kind of unscientific and theoretical planning that a few vocal propagandists would impose on the American people and on the American doctor!

Audaciously they accuse physicians as being responsible for the glaring faults in their plans, saying that the doctors in general failed to cooperate with them in the formation of plans. Actually their whole program was conceived and delivered by a small group of armchair theorists including a few misguided doctors who had neither the experience in medical problems nor the appreciation of the patient-physician relationship which would entitle them to presume to speak for medicine or the public interest.

Socialized medicine will inevitably reduce standards of performance in diagnosis and treatment to a lower average level in the alleged effort to aid distressed areas. These areas should have relief, but it would be as reasonable to destroy part of a prosperous farmer's crop so as to lessen the discrepancy between him and his less fortunate or less industrious neighbor as to reduce standards of medical practice by measures which will not help but rather will ultimately accentuate the deficiency of medical care in depressed areas.

LABOR AND SOCIALIZED MEDICINE

The medical implications of socialized medicine, so clear to physicians who have stopped to think, are poorly understood by the majority of nonmedical people. Perhaps this is no more strange than the fact that relatively few people have attempted to think through the problems of permanent world peace such as come to the fore toward the close of each war. Currently over one hundred books and innumerable articles have been written about peace. In medicine remarkable progress has been made in methods of the cure of disease and in lessening the duration of individual illness. Life expectancy, especially in the industrial and lower income groups, increased from 34 years in 1879 to 64 years in 1942. These advances together with the increase in number of available hospitals from one thousand to seven thousand in thirty years now have made possible actuarially sound hospital insurance at a price which the man of limited means can afford. Even since the first hospitalization plans were inaugurated a lessening of need as expressed by duration of hospital stay has occurred. The average need of 5 hospital beds per thousand of population which prevailed in 1920 is now nearer 3.5 beds per thousand because of improvement in medical service. The utilization of this accomplishment awaits the education of the public and the formation of resultant favorable public opinion.

While it might appear that medicine has been slow to publicize its own progress, definite programs can be proposed with reasonable assurance of safety and soundness only when sound actuarial statistics are available.

It is not surprising that organized labor, which represents a substantial portion of our population, has had difficulty in understanding the medical problem as applied to itself. This attitude of labor is understandable on review of its successes and its disappointments. The development of the labor movement, now over a hundred years old, has for its object the improvement of standards of living of the artisan and laborer. Such improvement is an important part of the desirable social changes and advances that have come in the complex of national and world living. Improved standards of living have come under the inspiration and guidance of many wise and forceful leaders. This extension has been delayed in certain periods and localities by the assumption of leadership by self-seeking reckless demagogues, whose actions have raised serious question as to their loyalty alike to their cause and to their coun-

¹ Should We Adopt Government Health Insurance? University of Chicago Round Table, number 354, National Broadcasting Company, Dec. 31, 1944, p. 3.

try. At times leaders have been unable to control sections of their own membership, so that the announced policies and promises of responsible leaders have been betrayed, to the detriment of the just cause of labor. In its operating agreements with employers representing capital, there have been breaches of contract now by one, now by the other. But through it all labor has come to occupy a prominent and essential part of our national, social and economic life. Observers might well anticipate, however, that labor is no better informed on the relationships of medicine than are other sections of the American public, and such is the case.

In past years medicine has found difficulty in getting even a conference with responsible labor leaders, notwithstanding the unquestioned importance to labor of the medical questions requiring discussion. Approaches were often made through management, which no doubt at once initiated distrust by labor. Cogent questions of measures to prevent exposure of shop employees to contagious disease of their sick colleagues, and more recently the cooperation of labor in industrial preventive medicine, first urged by physicians with a view to the protection of labor, have required much explanation before labor could be convinced of the overall desirability to labor of the measures proposed. Too often also the quality of medical care afforded labor by management in the early days did not inspire trust in the good faith of employers.

More recently, conferences have been held with labor and management concerning problems of physical fitness for specific operations in industry. As soon as labor representatives were assured of the sincerity of medicine, their resistance to conferences decreased. This is most encouraging. The holding of future profitable conferences will result in more complete understanding. Medicine has no "ax to grind"; medicine knows no class in providing its art and skill to the care of the sick.

The attitude of labor to socialized medicine is thus explainable by lack of information and possibly also by the use of the word "social," which has too often been loosely interpreted as having the connotation of "something desirable that we haven't yet got." If in place of socialized medicine there was substituted "government controlled medicine" the whole picture would be less attractive.

Just as the present stature of labor has been built by years of effort and vision, and standards of living of its members, though often still unsatisfactory, infinitely improved over those of former years, so the present achievements of medicine have been attained through decades and centuries of patient work and study. Neither labor nor medicine will care to contemplate the destruction of cherished ideals and standards. The establishment of socialized medicine in this country would destroy standards of medical practice and quality of service to the public, of which labor constitutes a large part. One of the aims of labor is to increase the economic freedom of its members; will labor wish to compromise this freedom by agreeing to the imposition of governmental medical domination? Will its members wish to be regimented as to their medical care and to join the panel of a state paid doctor, whose initiative and sense of personal responsibility to his patient are blunted by years of routine and unprogressive service? Both medicine and labor will do well to remember the adage of Benjamin Franklin "They that give up essential liberty to obtain a little temporary safety deserve neither liberty nor safety."

Present proposals for socialized medicine will result in a lowered quality of medical care for the worker. More important to us all, including labor, this is but the first step of a far wider plan for the socialization of our government. As each step is taken, the similarity to what took place in National Socialist Germany becomes apparent. Under the guise of improvement of medical care of certain groups of people whose present provision is clearly inadequate, measures are proposed which will lower the general level of care, so that the average of all will become inadequate.

As reiterated by Herbert Morrison in his discussion of the problems of English labor, "It is often forgotten today, as it was during the English industrial revolution, that the combination of capital savings and investment, with labor, made possible rapid advances in standards of living of workers as well as owners. The misfortune lay in the lag between standards for the well-to-do and for the less prosperous." Today efforts must be centered on the improvement of care for those groups in which it is deficient rather than on the reduction of the standards of living, including medical care, already enjoyed by labor as a part of the commonwealth.

The establishment of a system which provides low grade medical care will have the same effect in reducing the amount of care of a better grade as has cheap money in driving sound money out of circulation in the monetary system. In commerce and in medicine, if standards of living are to be maintained, quality of output must also be maintained. Reduction of quality lowers standards of living.

Our medical as well as our social and governmental problems must be solved with reference to our traditional ideology and economics and not with reference to what has seemed desirable to other nations differently situated. Nevertheless it should be noted that sweeping governmental plans looking to the socialization of medicine in New Zealand were decisively repudiated by popular vote in recent months, as soon as the people became aware of their real implications.

One of the most serious effects of the taking over of the practice of medicine by government as provided under proposed legislation will be the loss of personal, local, county and state responsibility and the substitution of a central governmental bureau. Already innumerable Washington bureaus seem to have taken over even legislative functions in that they are said to write 90 per cent of the bills passed by Congress; then under broad permissive provisions they undertake the functions of the federal judiciary and prosecute citizens for violations of laws which they themselves originated. Federal subsidies, some of which are beneficial to the nation as a whole, are in other cases made the instrument by which the will of a bureau is imposed on states and local communities. This system forces the sale of states' rights to a federal bureau for the price of a government subsidy.

This system will accentuate rather than decrease existing social injustices and tend toward totalitarian government, which in Germany eventuated in the attempt to rule the world and is now engulfing her in disillusionment and misery.

For the successful conduct of any community, moderate central government is necessary to secure justice and fair balance between cooperating elements. But, as in old Rome, when for political purposes government becomes paternal and proposes increasingly to order the lives of citizens, individual moral fiber

weakens and the state eventually crumbles. The nation is like the child who does not grow strong when everything is done for him. The sense of personal responsibility is lost. Socialized medicine will inevitably remove the feeling of personal responsibility of the state physician for the welfare of his patient, and the quality of medical service to labor as well as to the rest of the people will deteriorate.

Especially important is the distinction between those responsibilities that can best be undertaken by the individual and those that are more efficiently performed as a community effort. Experience has shown that some functions of complex community life cannot be carried out successfully by the individual, such as the defense of police power of home against thieves and aggressors, the protection of the larger community against external aggression by military force and in medicine the establishment of sanitary safeguards within and beyond the community borders by health departments and the Public Health Service. Here there is involved the process of dealing with situations and populations *en masse*, with a view to prevention and not cure of disease, by scientific and practical measures the effective employment of which requires lifetime study and experience of specially trained men. When, however, illness overtakes the individual, his care, while based on experience in the treatment of his disease, becomes a problem which cannot be met by mass measures if the rights of the individual are to be respected. The most ardent advocate of socialized medicine, when he himself becomes ill, properly demands that he be treated as a man and not as one of the herd.

The success of medicine on full time in the army is urged by some as evidence of the success of regimentation in the practice of medicine. It is forgotten that the patients are a selected, originally healthy group of soldiers who also are themselves completely regimented. The average conditions of army practice, other than the use of the best technical methods of medicine, are entirely different from those met in civilian life.

The experienced doctors who entered military service on a purely voluntary basis did so because of a wish to do their part in the service of the nation in a grave emergency. Their accomplishments were possible because they had been schooled in an atmosphere of freedom. The success of their efforts is attributable to their training and not to the system of regimentation under which they now work. The wish of an overwhelming majority is to finish the job and return, free to practice and advance in knowledge as they did before.

Over the centuries a progressive centralization of effort and division of labor have increased the production of goods, raised standards of living and increased leisure, in which benefits labor in common with the rest of the public now participates. For medicine this has meant increased facilities for study and fruitful research, more effective care of patients, and a remarkable increase in life expectancy. This prolongation of life, by which thirty years have been added in the present epoch in the most productive period of life, contributes directly to the rising standards of living.

Until the war is completely won, our primary thought is prosecution of the war effort, which has been carried on so magnificently on battle and home fronts by all, including labor and medicine. The war has made necessary the institution of innumerable restraints, policies and sacrifices of freedom to which the Ameri-

can people, who, after all, are the government, will not willingly submit after the war. Much less is it fair or wise during a period when men's minds are temporarily and willingly attuned to a necessary measure of regulation, and when a large proportion of the physicians of the country are away in its service, to impose a new system of regimentation which will fail to accomplish the ends for which it is avowedly proposed and also will destroy the standards already reached.

In the epoch which we are about to enter, the advances and service to mankind of medicine will be conditioned by coincident far reaching economic and social changes. Wise and forward looking counsel will be needed to guide these changes by evolution rather than by revolution which leads to destruction.

Medicine has always been and is now motivated by the desire to be of service to the public. To achieve this ideal, medicine must be free.

PRIMARY COCCIDIOIDOMYCOSIS

A POSSIBLE PEDIATRIC PROBLEM

MAJOR RALPH H. KUNSTADTER

AND

MAJOR ROBERT C. PENDERGRASS

MEDICAL CORPS, ARMY OF THE UNITED STATES

It is only during the past few years that a clear concept of the pathogenesis and clinical features of coccidioidomycosis has become apparent. Until 1936 to 1938, when Gifford¹ and Dickson² described "valley fever" as the primary or initial coccidioidal infection, this disease was considered only as the disseminated granulomatous form with an ultimate poor prognosis. Now, however, we know that the initial infection in many ways resembles primary tuberculosis, that complete clinical recovery occurs in most instances and that the granulomatous form is a dissemination following a breakdown of the primary stage.

Most of the recent reports have been concerned with young adults in the military service, such as we are presenting today. However, one of the earliest reports of primary coccidioidomycosis dealt with this disease as it occurred in a group of children. In 1939 Faber, Smith and Dickson³ reported 24 cases in children under 15 years of age and mention that in a questionnaire 3 per cent of patients were under school age and 18 per cent were of school age. Furthermore, Gifford, Buss and Donds⁴ found 26 per cent of their 104 patients with "San Joaquin fever" to be younger than 20 years of age. Recently Hess⁵ of Chicago mentioned the occurrence of disseminated coccidioidomycosis in a man aged 29 who had resided in endemic areas repeatedly since the age of 11 years. He had gone during winter months to convalesce from sinusitis and bronchitis.

From the medical and roentgenologic services, Ashford General Hospital, West Virginia.

Read before the Section on Pediatrics at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 14, 1944.

5. Hess, J. H.: Personal communication to the authors.

We are presenting this paper before the Section on Pediatrics because we believe that this disease has not received the attention it deserves from a pediatric standpoint. Pediatricians practicing in or near endemic areas of southern California, southern Arizona, southern Utah and western Texas unquestionably are more familiar with this disease than those of us practicing in other parts of the country. However, with modern rapid transportation facilities and increase in migration of populations the disease may be seen throughout the entire United States. Our problem is that of recognition of coccidioidomycosis, particularly in children returning from endemic areas in the Western states, where they have been sent to obtain the advantages of a dry climate in the treatment of respiratory diseases. It is significant that Faber and his group³ found that recent arrival in an endemic region was a predisposing factor. Evidently, acquired immunity occurs in a large proportion of individuals who have lived in endemic areas over a long period.

Sensitization to the fungus occurs following inhalation of contaminated dust, producing symptoms and tissue changes paralleling the primary infection in tuberculosis.³ Dickson⁶ suggests that the primary infection may be in the pulmonary parenchyma like the foci of Ghon.

We should be familiar with what might arbitrarily be considered three phases of the primary form: The acute stage, subacute or chronic active stage and the arrested or healed stage. Each is characterized clinically by significant features, the first by acute respiratory disease frequently associated with erythema nodosum and/or erythema multiforme and arthritic symptoms occurring usually two to three weeks after the initial infection. The subacute or chronic active stage may be considered as that period following the disappearance of acute manifestations in which, however, there is evidence of activity as manifested by changing pulmonary lesions in chest roentgenograms. This period may last from weeks to months. The last stage is designated as any time following disappearance of active infection when clinically silent lesions are demonstrated radiographically.

Our patients were mainly seen either in the second or in the third stage, as they were observed several weeks or months after they contracted the initial acute infection while in an endemic area. Briefly, a few words should be mentioned relative to the acute manifestations.

THE ACUTE STAGE

The acute stage is called by Smith⁷ the acute respiratory "influenza" or "pneumonic" form (rarely diagnosed in civilian practice). The incubation period varies from eight to twenty-one days. The onset may be abrupt or insidious. Thoracic pain, pleuritic in nature, frequently bilateral, is common, occurs early, is usually prolonged and is aggravated by cough. In Goldstein and McDonald's⁸ group of cases it occurred in 88 per cent, and an initial diagnosis of pleurisy was not infrequent. Cough is frequent, occurring in approximately 88 per cent of the cases, and is usually productive of yellowish brown sputum; at times particles of dust or sand may be observed. The cough may last a few days, two or three weeks, or, as in some of our cases, over

a period of several months. Hemoptysis may occur and is unrelated to the severity of the symptoms or the pathologic condition of the lungs. Chills and fever are frequent and usually last from two to four days. The temperature may range from slightly over normal to as high as 104 F. and may last for a few days or persist as a low grade fever for weeks. Many of the patients complained of sore throats at the onset, and pharyngitis and tonsillitis was a frequent initial diagnosis. Smith⁷ describes a fine macular generalized rash within the first few days of the onset resembling measles, scarlet fever or drug eruption. One of our patients recalled a measles type of rash on the third day of his acute symptoms. Physical examination may reveal signs suggestive of acute bronchitis, pneumonic consolidation or pleurisy. Within eight to fourteen days erythema nodosum and/or erythema multiforme occurs in 5 to 20 per cent of the cases. At this time arthritis pains occur rather commonly in approximately 30 per cent⁸ unaccompanied by joint swelling. The lumbar spine and lower extremities are most commonly involved. During this stage the blood frequently shows an eosinophilia. The total leukocyte count is not significant. The sedimentation rate is consistently elevated and may remain elevated after an apparent clinical recovery. The coccidioidin skin test is positive.

SUBACUTE OR CHRONIC ACTIVE STAGE

In the second group we are considering those patients who have active disease but either give no history of an acute attack or have recovered from the acute clinical manifestations mentioned heretofore. Some of our patients have been previously hospitalized elsewhere because of fatigue, loss of weight, chronic cough, chest pain and some because of low grade fever. In many a diagnosis of coccidioidomycosis was suspected on the basis of a history of residence in an endemic area. In others, initial diagnoses of bronchitis, pulmonary tuberculosis, bronchiectasis, atypical pneumonia, pleurisy and asthmas were considered.

Examination usually revealed evidence of weight loss and slight elevation of afternoon temperature. Examination of the thorax frequently revealed no abnormal findings, while, in others, evidence of pleural thickening, areas of impaired resonance and harsh breath sounds were found. Rales were conspicuously absent except in 1 patient who had a coexisting bronchiectasis and in another who had active pulmonary tuberculosis. Another patient had an asthmatic type of wheezing. A presumptive diagnosis was based on a history of residence in an endemic area, occasionally with previous acute upper respiratory episode, a positive coccidioidin skin test, elevated sedimentation rate and radiologic evidence of active pulmonary disease on serial x-ray examinations. In some patients the fungus was isolated from the sputum by culture and in 1 by guinea pig inoculation; in others it was not found. Repeated sputum specimens and gastric washings were examined for tubercle bacilli and none were found except in the 1 case with cavitation.

CHRONIC ARRESTED OR HEALED STAGE

In the third group we have considered a group of circumscribed nodular lesions as found on radiologic examination, with a history of residence in an endemic area, responding with a positive coccidioidin skin test. Most of these were found on routine examination and were asymptomatic as far as pulmonary disease was concerned. The sedimentation rate was normal. Cough usually was absent and there was no sputum. Gastric

7. Smith, C. E.: Coccidioidomycosis, *M. Clin. North America* 27:791 (May) 1943.

8. Goldstein, D. M., and McDonald, J. B.: Primary Coccidioidomycosis, *J. A. M. A.* 124:557 (Feb. 26) 1944.

washings were negative for both fungi and tubercle bacilli.

Smith⁹ has demonstrated arrested pulmonary lesions, some calcified, mistaken for tuberculosis roentgenographically and at autopsy. We were further encouraged with respect to our interpretation of these lesions by the opportunity of seeing a solitary coccidioidomycosis nodule in the right lung and scattered miliary nodules in the left lung of a soldier on whom an autopsy was performed for accidental death, as shown in the accompanying illustration. Grossly, the lesions resembled tuberculosis and showed evidence of both healing and activity. The diagnosis was established by demonstration of the fungus in tissue sections.

DIAGNOSIS

In establishing a diagnosis of coccidioidomycosis, the following points in the history are of great significance:

1. Residence or visits in an endemic area.
2. An acute episode of respiratory disease, not infrequently followed in two or three weeks by erythema nodosum, erythema multiforme or both.

Large caseous lesion of coccidioidomycosis in the right lung. Accidental death; no pulmonary symptoms. Organism found in lesion.

During the primary infection there may be hilar adenopathy, patchy parenchymal infiltration or pleurisy with effusion. One or all three manifestations may occur. The primary radiologic findings may be consistent with a bronchopneumonia or an epituberculosis and may be difficult to differentiate from childhood tuberculosis. In adults a mottled apical infiltration may resemble an acute reinfection type tuberculosis or atypical pneumonia. More rapid resolution of the acute lesions is seen in coccidioidomycosis than in tuberculosis. Cavitation may occur within the first few weeks of the disease, and the majority of the cavities are thin walled.

After recovery from the acute stage, physical findings are usually absent. Chronic cough and chest pain are frequent complaints. There may be an evening temperature elevation. Hemoptysis is not common. Sputum is not abundant and has no characteristic appearance. Many late cases are asymptomatic, and residual lesions are found on routine radiographic examination

of the chest, which may show linear fibrotic markings, thickened pleura, atypical parenchymal infiltrations or nodular lesions resembling solitary tuberculous lesions, or metastases. Hilar adenopathy may or may not be present. Smith¹⁰ and Carter¹¹ have described nodular lesions in the primary and arrested stages.

Colburn¹² states that "permanent fibrotic residues are not conspicuous. Areas of exudation clear fairly rapidly (ten to twenty days) but infiltrates require thirty to ninety days and occasionally longer." We believe that prolonged radiographic observation may show the presence of nodular densities after all other radiographic evidence of the disease has cleared.

Sarcoidosis, the lymphomas and fungous infections, other than coccidioidomycosis, must be considered in a differential diagnosis (Carter¹¹ and Fawcitt¹³).

The following 3 cases illustrate the necessity of considering a fungous infection as an explanation for nodular pulmonary lesions, or cavities, as observed on roentgenograms:

CASE 1.—A routine chest examination in December 1943 showed multiple nodular lung lesions in a soldier hospitalized for a radial nerve injury. No primary malignant focus could be discovered, and investigation disclosed that in October 1942 he suffered an attack of "bronchopneumonia" while at a desert training station. Review of films made during this attack revealed soft, rounded infiltrations in both lungs, corresponding exactly to the sites of the residual lesions noted by us fourteen months later. He had a strongly positive coccidioidin skin test. These lesions were still present on the film made March 20, 1944, seventeen months after the initial infection.

CASE 2.—A soldier with a history of training in a desert area, whose chief complaints were cough and chest pain, and who on admission six months after initial exposure showed hilar adenopathy and nodular parenchymal infiltration, developed several nodular pulmonary lesions during a five months period of observation. The coccidioidin skin test was positive, and sputum cultures revealed *Coccidioides immitis*.

CASE 3.—A patient examined to determine the cause of chronic cough showed a thin walled cavity in the right upper lobe on a chest roentgenogram. He gave a history of being stationed in a desert area eleven months previously. The coccidioidin skin test was positive. Tubercle bacilli were recovered from the sputum, and *Coccidioides immitis* was found in another specimen. Inoculation of one specimen produced coccidioidial lesions in the retroperitoneal lymphatics of a guinea pig, with demonstrable ascospores. Radiographically no distinction could be drawn between a tuberculous and a coccidioidial cavity in this case.

A positive intradermal test with coccidioidin indicates an allergic reaction comparable to the positive tuberculin test, i. e. either present or past infection. Rapid change from an inactive to a positive reaction is an indication of activity. A positive test may persist for years. Positive diagnosis is established by isolation of *Coccidioides immitis* from the sputum, or gastric washings cultured on Sabouraud's medium and confirmed by guinea pig inoculation.

Smith⁷ states that precipitin and complement fixation tests have proved useful. However, up to the present time difficulty in obtaining the antigen has prevented widespread use of these tests. In mild initial infection these tests are negative, and the more severe the infec-

tion the more likelihood of their being positive. Precipitins are usually present in primary infections but rarely demonstrable in the disseminated form. The complement fixation rises with the severity of the infection, and these tests therefore may be of value in following the course of an active infection.

PROGNOSIS

The prognosis is usually excellent, although convalescence may be prolonged over a period of weeks or months and residual lesions may remain indefinitely. Only time will tell as to whether or not residual nodules disappear entirely or undergo complete calcification. All but one of Goldstein's⁸ 85 patients recovered, and almost all were sent to duty within a period of several weeks to a few months. All but 2 of our patients, 1 with coexisting pulmonary tuberculosis and another with bronchiectasis, returned to duty of a limited nature. When dissemination occurs there is less than a 50 per cent chance of recovery. Treatment is purely symptomatic.

COMMENT AND SUMMARY

The radiographic manifestations of coccidioidomycosis are variable, but the initial pulmonary infection commonly resembles childhood tuberculosis of bronchopneumonia. One of the more common manifestations of the chronic stage of the disease is the appearance of single or multiple nodular lesions in the lung which may readily be confused with nodular tuberculous lesions or metastases from . . . Careful study of these lesions . . . a magnifying lens will usually reveal serration of the edges.

As Carter¹¹ has so aptly stated, "It is, perhaps, more important to acquire grounds for the suspicion of a fungous disease than to acquire skill in differentiation between them."

ABSTRACT OF DISCUSSION

MAJOR WILLIAM H. WOOD JR., M. C., A. U. S.: The cause of coccidioidomycosis is a fungus which grows in the desert as hyphae. These long filaments break up into sections, or chlamydospores. When the chlamydospore is inhaled by animals or man it changes into an endospore, which is the pathogenic form of the fungus. Certain rodents seem especially susceptible to *Coccidioidomyces*. The Army makes use of this fact by examining the lungs of rodents in desert regions prior to staging maneuvers in these areas. Our patients with coccidioidomycosis have been few. Most of them lived in the East or Midwest. They were sent to California, Arizona, New Mexico or Texas for training purposes. They are young men who have had x-ray examinations of their lungs routinely or because they had respiratory infections. They come to us with a tentative diagnosis of tuberculosis. To differentiate coccidioidomycosis from tuberculosis, the clinical story is important. Location and appearance of the x-ray shadow is also helpful. Typically that of tuberculosis is reticulopneumonic, while that due to coccidioidomycosis is in the middle or lower lung fields. Cavities, if present, due to this condition have thinner walls and are more cystlike than those due to tuberculosis. The coccidioidin skin test, comparable to the tuberculin, should be employed. The sputum and gastric washings should be examined for fungi. There is a precipitin test and a complement fixation test, said to be helpful, but we have not been able to do these tests in our laboratory. The former is said to be present early, and the latter present in high titer during the secondary or granulomatous, spreading form. Other conditions which must be considered in the differential diagnosis are lymphoma, sarcoma and metastatic or embolic foci in the lungs. In some cases the physician is unable to establish the diagnosis with certainty. We feel that all such patients should be treated as though they had tuberculosis.

HEMOLYTIC TRANSFUSION REACTIONS DUE TO RH INCOMPATIBILITY

MANIFESTATION OF SENSITIVITY TO THE RH
FACTOR MANY YEARS AFTER IMMUN-
IZATION BY PREGNANCY

LAWRENCE E. YOUNG, M.D.

AND

DONALD H. KARIHER, M.D.

ROCHESTER, N. Y.

Routine cross matching of donor's cells with recipient's serum for demonstration of acquired isoagglutinins is inadequate. Since the transfusion service of this institution was centralized in November 1943 and all reactions were subjected to complete investigation by the personnel of the blood bank, nearly 1,000 transfusions have been given without evidence of a single reaction due to intergroup incompatibility. However, during this period there have been observed in 3 female patients 5 hemolytic reactions, all of which were due to acquired sensitivity to the Rh factor. In each instance cross matching had been carried out by the test tube centrifuge method, first at room temperature and later at refrigerator and body temperatures, without detecting incompatibility. This inability to predict intragroup reactions is due to the fact that many times the acquired Rh antibody is not demonstrable in vitro tests.

The transfusion reactions which occurred in this hospital during the seventeen years prior to the organization of the blood bank cannot be tabulated with any degree of accuracy. However, so far as is known, the only previously observed intragroup hemolytic reaction was that described by Kariher and Spindler¹ in connection with a study of hemolytic disease of the newborn.² In view of our recent experience, the apparent scarcity of such reactions during the prebank period indicates that many were probably overlooked.

The cases presented in this report clearly illustrate the great length of time that may elapse between the last sensitization to the Rh factor and a subsequent transfusion reaction. Levine³ states that once an individual is sensitized by the Rh factor that sensitization is probably retained throughout life. In this report are presented cases of proved retention of sensitivity nearly eight and sixteen years respectively after the last immunization by pregnancy.

Transfusion reactions due to Rh incompatibility may be typical or they may be bizarre, and therefore minor reactions can easily go undetected. However, if the Rh negative patient who has this minor reaction is given another transfusion of Rh positive blood he may have a more violent reaction which could prove fatal. It is of the utmost importance therefore to investigate all reactions, minor or severe, so that the exact cause can be determined and a recurrence of the accident, perhaps in a more severe form, be prevented. The procedure now used in this hospital in investigating transfusion reactions is presented briefly. Since it is desirable that all Rh negative individuals be transfused with Rh nega-

tive blood, our bank has now been organized in such a manner that this ideal can be achieved. A workable plan for the prevention of those intragroup reactions due to Rh incompatibility is presented.

REPORT OF CASES

CASE 1.—*History*.—E. S.,⁴ a white woman aged 40, married, tertipara, quadrigravida, was admitted to the Strong Memorial Hospital on Nov. 14, 1943. Her blood pressure was 120/80. Her red blood cell count was 3,570,000, her hemoglobin 10.8 Gm. per hundred cubic centimeters.

A radical mastectomy was performed November 15. Immediately after the operation a transfusion of 500 cc. of citrated, 1 day old whole blood (group A, Rh positive) was given before she had reacted from the ether anesthesia. Fifteen minutes after

and she gained strength rapidly. Aside from a urinary infection due to *Escherichia coli* her course thereafter was uncomplicated.

As shown in the table, further inquiry revealed that in 1925 she had had a miscarriage. In 1926 her second pregnancy was complicated by preeclamptic toxemia. Because of elevation of blood pressure to 186/102, ankle edema, persistent headaches and albuminuria labor was induced at eight and one-half months, and a normal female child was delivered. Her preeclamptic symptoms then promptly subsided and her blood pressure was never again found to be elevated until November 1943, as already mentioned. In 1927 she gave birth to a second normal female child after an uncomplicated pregnancy. On Feb. 7, 1936, nine years after the last pregnancy, she gave birth to a third female child. This baby appeared normal at birth but on the second day pronounced jaundice developed; the child became

the transfusion was completed she had a mild shaking chill, but at no time did her temperature rise above 100 F. Ten hours after the chill she voided dark amber urine, which unfortunately was not tested for hemoglobin. She had a moderate oliguria, and her postoperative course was further marked by nausea, frequent emesis and lassitude, but she did not become jaundiced.

Nine days after transfusion, when she was seen by a medical consultant, her hemoglobin was 11.2 Gm. per hundred cubic centimeters, blood nonprotein nitrogen 160 mg. per hundred cubic centimeters, creatinine 9.2 mg. per hundred cubic centimeters. Her blood pressure had risen to 160/90 but her fundi were negative and the cardiovascular findings were within normal limits. By the following day, when the possibility of a hemolytic transfusion reaction was first suggested, the blood specimens collected from donor and patient prior to transfusion had already been discarded. Nevertheless the investigations to be outlined presently were begun. During the next two weeks the patient's blood chemistry and blood pressure became normal

progressively paler, and the liver and spleen became palpable. On February 20 the red blood cell count had fallen to 1,810,000, the hemoglobin to 6.0 Gm. per hundred cubic centimeters and a single nucleated red blood cell was seen in a careful search of the blood smear. On that day she was given 50 cc. of blood from her father, and on the following day 75 cc. of blood. After each of these transfusions she became more deeply jaundiced but less pale. On February 23 the icterus index was 60, red blood cell count 3,190,000, hemoglobin 8.5 Gm. per hundred cubic centimeters. Thereafter the child steadily improved and has since been normal.

The only other item of importance in the patient's past history is the report of an intravenous pyelogram of March 19, 1941 showing pyelectasis of the right kidney and constriction of the ureteropelvic junction. It is possible that previous renal damage was partly responsible for the azotemia which developed after the transfusion reaction.

Blood Studies.—After the question of transfusion reaction was raised, it was learned that the blood of the patient and her family had been studied shortly before her operation in a laboratory separate from the blood bank. In the table are shown the

4. Dr. John J. Morton gave the authors the privilege of studying this case. Dr. John S. Lawrence first pointed out the probability of a hemolytic reaction by the patient.

blood groups of the S. family and of the donor who later provided a fresh sample of blood for grouping. No anti-Rh agglutinins could be demonstrated in the patient's serum against Rh positive cells from 3 individuals when tested before transfusion, but twenty-four days after she received the Rh positive blood the anti-Rh titer had reached a maximum of 1:32,000.⁵

On Nov. 26, 1943, eleven days after transfusion, the patient's red blood cells were completely agglutinated by anti-M serum,

Fig. 1 (figures 1, 2, 3, 4 and 5 illustrate survival of transfused Rh negative cells, types M and MN, demonstrated by mixing anti-M serum with suspension of patient's cells (case 3, type N) after transfusion with Rh positive blood, but before transfusion with Rh negative blood; no agglutination because all cells are type N (patient's).

but no agglutination occurred with anti-Rh or anti-N serums. Since the donor's blood was Rh positive, type MN, this test indicated that all of the transfused cells had been destroyed.⁶ It is unfortunate that these studies were not carried out earlier, but even if a demonstrable portion of the donor's cells had survived to the tenth day this would have been only one-tenth the expected survival period for 1 day old citrated blood.⁷

CASE 2.—History.—E. P., a woman aged 43, quadripara, septigravida, was admitted to Rochester Municipal Hospital on May 31, 1944 for treatment of a relaxed pelvic floor with cystocele and rectocele. Her preoperative blood counts were red blood cells 4,000,000, hemoglobin 14.0 Gm. per hundred cubic centimeters, white blood cells 7,600. The urinary findings were normal. On June 2 a complete repair operation was carried out. In the course of the operation the patient bled profusely, so that supportive measures were indicated. Consequently, during and immediately after the operation the patient was given 700 cc. of isotonic solution of sodium chloride, 400 cc. of plasma and 500 cc. of group O blood to which 5 cc. of A and B specific substances had been added.⁸

There was no obvious immediate reaction (the patient was still under anesthesia) but in the evening of the day of operation her temperature had risen to 102 F. and the pulse rate was 182. Blood pressure was 90/65. The urinary output was only 50 cc. in the twenty-four hour period. By the following morning the temperature had risen to 103.4 F. and the patient was noticeably jaundiced. Her fluid intake this day was 2,800 cc. and her urinary output was 160 cc. By the third postoperative day (two days after operation) the icterus index was still 36 and

the nonprotein nitrogen had risen to 92 mg. per hundred cubic centimeters. It was not until the twelfth postoperative day that these chemical findings returned to normal. Catheterized specimens of urine were negative except for a 2 plus reaction for albumin. Hemoglobin on the fourth postoperative day was 11.2 Gm. and red blood cells numbered 3,800,000. Two days later the hemoglobin had further decreased to 9.8 Gm. The patient gradually improved and made an uneventful recovery.

The patient's obstetric history as summarized in the table is of great interest. Following the transfusion the Rh status of the patient was investigated along with that of the available members of her family. These results are also shown in the table. Anti-Rh agglutinins were demonstrable in a low titer in the patient's serum three days following transfusion, whereas none were found in blood drawn prior to the transfusion. Five days following transfusion the anti-Rh agglutinin titer had risen to 1:32. Three days following transfusion complete destruction of the donor's cells, type O N Rh +, was easily demonstrated by tests with B, anti-M and anti-Rh serums, since the patient's type was A₁ MN Rh —.

CASE 3.—D. S., a white married woman aged 34, quintipara, octigravida, was admitted to the Rochester Municipal Hospital on Feb. 24, 1944. Two days later she underwent a complete repair operation which involved considerable loss of blood. During her first five postoperative days she received three whole blood transfusions of 500 cc. each, but nevertheless her hemoglobin remained at 8 Gm. per hundred cubic centimeters. On March 2, the day following the third transfusion, she was jaundiced, her icterus index was found to be 52, indirect bilirubin 8.7 mg. per hundred cubic centimeters, direct bilirubin 1.4 mg. per hundred cubic centimeters and hemoglobin was demonstrated spectroscopically in her serum. She had had none of the usual symptoms of a transfusion reaction, but her temperature had risen to 101 F. after the third transfusion.

Blood Studies.—Investigation revealed that the patient was Rh negative and all three donors were Rh positive, but anti-Rh agglutinins could not be demonstrated at any temperature in the serum drawn before operation or in any serums drawn during the next two months. Differential agglutination tests with anti-M and anti-Rh serums showed that on the day following

Fig. 2.—One day after first transfusion of Rh negative blood, type MN; an increasing degree of agglutination.

5. The results of the titrations of anti-Rh agglutinins were confirmed by Dr. Philip Levine. He agreed that this serum showed a definite prozone.

8. Witelsky, E.; Klendshoj, N. C., and Swanson, P.: Preparation and Transfusion of Safe Universal Blood, *J. A. M. A.* 116: 2654 (June 14) 1941. The A and B specific substances were supplied by the Eli Lilly Company, Indianapolis.

the second transfusion Rh positive (M and MN) cells were still present in the patient's circulation. Two days later, however, these cells and all of the third donor's cells had been destroyed. During the next four days she received three 500 cc. transfusions of Rh negative blood, which produced a rise in her hemoglobin to 13 Gm. per hundred cubic centimeters. Since the patient belonged to type N and the 3 Rh negative donors to types M or MN, it was possible to show an increasing percentage of cells

agglutinable with anti-M serum after each of the last three transfusions (fig. 1). Moreover, these Rh negative cells containing the M factor were still demonstrable in the patient's blood ninety days after the last transfusion.

The patient's previous transfusions and obstetric history are recorded in the table. From 1928 to 1941 she had had eight

the patient's record gives no conclusive evidence of rapid destruction of the cells of these donors, it is noteworthy that she had chills and fever after three of the nine transfusions, and all 3 of these donors have been found to be Rh positive. On the other hand, the blood from the 3 individuals subsequently found to be Rh negative caused no reaction. Only once did she receive known Rh positive blood without recorded reaction. The Rh type of 2 of her previous donors has not been determined.

COMMENT

Clinical and Laboratory Diagnosis of Hemolytic Reactions.—It has been pointed out by Wiener and his associates⁹ that in the majority of cases chills and fever following transfusion are due to nonspecific agents. On the other hand, the donor's cells may be destroyed rapidly because of specific incompatibility without causing any alarming symptoms. The mild chill of patient 1 was largely overlooked because she was under anesthesia and because it was not followed by any rise in temperature. In addition, her oliguria and passage of dark amber urine were disregarded and it was not until her blood nonprotein nitrogen was found to be 160 mg.

Fig. 3.—One day after second transfusion of Rh negative blood, type M; an increasing degree of agglutination

pregnancies. Three of her 5 living children were found to be Rh negative and 2 Rh positive; the last Rh positive child was born in 1931. In 1929, after a pregnancy of seven months, she gave birth to a stillborn child with a meningoencephalocele. In 1938 and 1941 she had self-induced abortions after three months of pregnancy. The Rh type of the 3 fetuses is, of course, unknown. However, it is significant that at no time did she

Fig. 4.—One day after third transfusion of Rh negative blood, type MN; an increasing degree of agglutination.

give birth to a child with manifestations of hemolytic disease of the newborn. Perhaps, if the last two pregnancies had been allowed to go to term, 1 or both of the infants might have suffered from the disease. Prior to the six transfusions described, she had had five transfusions after her abortion in 1938 and four more following the abortion in 1941. Although

Fig. 5.—Control: cells of known type M from another person; practically complete agglutination.

per hundred cubic centimeters that a hemolytic transfusion reaction was suspected. In cases 2 and 3 the fever which followed transfusion was thought at first to be related to the operation, and the possibility of a hemolytic reaction was not considered until jaundice developed.

The importance of vigilance on the part of those in charge of transfusions and the necessity of systematic investigation of any untoward symptoms or signs cannot be overemphasized. The procedures to be followed in studying reactions have been set forth in detail by Wiener,¹⁰ Schiff and Boyd,¹¹ Mollison¹² and others. In the Strong Memorial Hospital Mollison's plan is now adhered to as strictly as possible. This involves an attempt to demonstrate (1) the occurrence of increased blood destruction and (2) its cause. The

Wiener, Silverman and Aronson¹⁵ reported the case of an Rh negative woman who had hemolytic reactions after each of three transfusions of Rh positive blood given eleven years after the birth of the last of 5 Rh positive children. In none of these children was there any evidence of hemolytic disease of the newborn; nevertheless the mother had been sensitized and retained her sensitivity for eleven years. Mollison¹² observed a similar case of hemolytic reaction in a woman fourteen years after the last of four presumably normal pregnancies. Vogel, Rosenthal and Levine¹⁶ and Kouchy¹⁷ demonstrated the presence of anti-Rh agglutinins in the serums of women following their first transfusions, which were given nine years and twenty-three years respectively.

Limitations of In Vitro Tests for Rh Antibodies.—It has been found that anti-Rh agglutinins can be demonstrated in less than half of the Rh negative mothers of children with hemolytic disease of the newborn.³³ They usually disappear within six months to two years but have been found as late as six years after preg-

Fig. 6.—Form for recording in chronological order results of investigation of transfusion reactions. A SER, B SER and ABS B SER indicate A serum, B serum and absorbed B serum respectively used in grouping cells (and subgrouping A and AB cells). A cEH and B cells indicate known A and B cells used in checking presence of recipient and donor for anti-A and anti-B agglutinins. Anti-Rh, anti-M, and anti-N serums determine the presence or absence of these factors in cells of recipient and donor. DC = donor's cells; RS = recipient's serum; DS = donor's serum; RC = recipient's cells. RC + RS are tested at 0 C. as a check on cold agglutinins.

nancy.¹⁹ Nevertheless, virtually all such mothers are presumably immunized against the Rh factor and may have and maintain tissue sensitivity when the antibodies cannot be detected in the test tube. The importance as regards transfusion reactions of antibodies bound to cells and not demonstrable *in vitro* has been amply discussed by Wiener²⁰ and Levine.¹⁸

It is obvious that Rh incompatibility is a grave potential danger which must be faced by every one who has anything to do with the transfusion of whole blood or red cells. Although it has been sufficiently demonstrated that in the majority of instances this danger cannot be predicted by any sort of in vitro test thus far devised, Wiener's¹⁵ biologic test is no doubt a more sensitive indicator of Rh incompatibility. Kouchy¹⁷ states that Rh negative pregnant or puerperal women may be given Rh positive blood provided this test is negative. However, it seems entirely possible that in some cases of hemolytic reaction due to Rh incompatibility the hemolysis may be delayed beyond the test period of one or two hours and therefore may be missed. This might be expected particularly in patients whose last immunization by the Rh factor occurred many years prior to the transfusion. In such patients a number of hours or perhaps several days might be required for the anamnestic reaction²¹ to manifest itself. The findings in case 3 illustrate this possibility. As previously pointed out, on the day after the second transfusion some Rh positive M and MN cells were still present in the patient's blood, but two days later these cells and all of the third donor's cells had been destroyed. This suggests an acceleration of the hemolytic process after each successive transfusion.

Another scheme advocated by Kouchy is that of completing the transfusion program within a period of five or six days before antibodies can develop. He suggests that Rh negative individuals may thus be transfused with Rh positive blood. Although this practice may result in few severe reactions, it should be pointed out that even the first Rh positive cells given to an Rh negative person of either sex may survive for a relatively short period in the patient's circulation.²² The destruction of the donor's cells may not be sufficiently rapid to cause clinical symptoms and signs, but nevertheless the patient will be deprived of full benefit from the transfusion. A still more serious objection to Kouchy's proposal is that the injection of Rh positive blood into an Rh negative individual at any time may produce lifelong sensitivity to the Rh factor. This is particularly important in women who may thus lose their next child (or possibly their very first child) as the result of hemolytic disease, as suggested by Diamond.²³ Moreover, it should be emphasized again that Rh negative women, sensitized by pregnancy—even normal pregnancies many years before—may have severe hemolytic reactions following their first transfusion of Rh positive blood.

Plan for Prevention of Reactions.—In the light of our present knowledge it appears that the only safe plan for prevention of intragroup hemolytic reactions is that of giving only Rh negative blood to all Rh negative individuals. This practice is expensive and troublesome, but the recent experiences cited in this paper indicate that it is fully justified. The current policy of the Strong Memorial Hospital and Rochester Municipal Hospital is as follows:

1. Rh tests are performed free of charge on all donors, all transfused female patients, all obstetric and gynecologic

patients and all male patients who have received more than two transfusions.²⁴

2. When major surgery is contemplated for such patients, blood for grouping and Rh determination is sent to the bank before 8:45 a. m. of the day of operation. Except in emergencies, no female patient is sent to the operating room for major surgery unless her Rh type has been or is being determined.

3. Only Rh negative blood is given to the aforementioned Rh negative patients, and eventually this will be extended to include all males, regardless of their history of previous transfusions. Rh negative blood is also given to Rh positive infants with hemolytic disease of the newborn, as recently recommended.²⁵

4. If Rh negative blood is not available in the bank when needed, it is purchased from professional donors, most of whom are members of the institutional personnel. This means that most of the blood purchased by the bank, with funds provided by private patients, is Rh negative.

5. A special effort is made to keep group O, Rh negative blood in the bank at all times. In emergencies, if it is necessary to give this blood to persons of group AB, A or B, 5 cc. of a solution of A and B specific substances is added to neutralize the anti-A and anti-B agglutinins.

6. A transfusion requisition form, similar to that recommended by Butler, Danforth and Scudder²⁶ and by Barton²⁷ gives information regarding the obstetric history of the patient and any previous transfusion reactions. This serves to keep both the intern and the personnel of the bank on the alert for situations in which Rh incompatibility is apt to be found.

7. As an added measure of safety for Rh negative patients and in certain other cases, triplicate mixtures of donor's cells and recipient's serum are checked by the test tube-centrifuge technic²⁸ after standing at 37 C., room and refrigerator temperatures for one hour.

SUMMARY

1. The occurrence of hemolytic transfusion reactions due to Rh incompatibility in 3 women emphasizes the following points:

(a) Serious hemolytic reactions may follow transfusion without causing chills, fever or other dramatic symptoms or signs.

(b) Sensitivity to the Rh factor, once it is acquired, may persist for many years, probably for life.

(c) Rh incompatibility is often unpredictable by any sort of in vitro matching test.

2. Prevention of such reactions consists only in always giving Rh negative blood to Rh negative patients. This necessitates a complete reorganization of the blood bank so that Rh negative blood will always be available.

3. The study of reactions involves not only the rechecking of the groups and cross matchings but, in addition, the chemical examination of the blood and urine as well as the determination of the survival of the transfused red blood cells.

24. The anti Rh serums used in all determinations are of the 87 per cent variety. The various types of anti Rh serums have recently been discussed by Levine.³

FETAL ERYTHROBLASTOSIS

ISRAEL DAVIDSOHN, M.D.

CHICAGO

The diagnosis of fetal erythroblastosis does not, as a rule, present serious difficulties to those familiar with its clinical picture and laboratory findings. However, in some instances the diagnosis is not easy. The difficulties are due to several reasons. One is that the term actually includes three distinct clinical entities: fetal hydrops, icterus gravis and congenital anemia of the newborn. The fact that they are related genetically and etiologically and that children of the same mothers may alternately manifest any one of the three forms of the disease does not lessen the diagnostic difficulties in individual cases. Another source of difficulty is that there are mild forms of the disease which may be overlooked or misinterpreted. The third difficulty is that none of the manifestations of the disease are pathognomonic. Every one of them may be found in certain other diseases.

The diagnostic difficulties have been thrown into sharp focus because the diagnosis of fetal erythroblastosis has assumed increased practical importance since the recognition of the role played by the Rh factor¹ has led to advances in therapy which permit the saving of many children that would have died in the pre-Rh era.

My main purpose in this paper is to show how the study of the Rh factor can be helpful in the diagnosis of fetal erythroblastosis, especially in cases with diagnostic difficulties. The Rh factor was studied in all patients and in their parents and repeated hematologic studies were done whenever it was possible. Table 1 lists diagnostic findings in fetal erythroblastosis and in a group of diseases which may have to be differentiated from fetal erythroblastosis. The items listed in the uppermost column occur with varying frequency and intensity in fetal erythroblastosis. Any one of them or any combination of them may be present or absent. Not one of them is absolutely pathognomonic for the disease except anti-Rh agglutinins, the presence of which in the mother suggests strongly fetal erythroblastosis in the baby. However, that too is not an absolute rule. I have found several instances in which anti-Rh agglutinins were found in the mothers but the babies were born normal. One such case in which the agglutinins persisted from a previous pregnancy will be the subject of a special report.² The absence of anti-Rh agglutinins in the mother does not exclude the disease in the child, even if the Rh factor is responsible for the disease. It should also be kept in mind that a certain proportion (about 10 per cent) of cases of fetal erythroblastosis are not caused by isosensitization by the Rh factor. All other findings may be present in certain other diseases.

The fact that anti-Rh agglutinins in the mother are, as a rule, specific for fetal erythroblastosis in the child, that they are not found as responsible agents in any other disease, and that the combination Rh positive

father and baby and Rh negative mother is found in about 90 per cent of cases of the disease has added a new criterion for the diagnosis of the disease to the three known previously: the clinical, the hematologic and the pathologic. The new diagnostic aids are tests for the Rh factor in the father, mother and child, and for anti-Rh agglutinins in the mother. It would hardly seem necessary to state that the finding in a family of the previously mentioned Rh factor combination does not, by itself, prove that an illness, for instance jaundice, edema or anemia in a newborn child, is fetal erythroblastosis. Yet a tendency has become manifest recently to diagnose the disease on flimsy evidence, sometimes on no more evidence than that the mother is Rh negative. The finding of the characteristic distribution of the Rh factor may be used as evidence in favor of erythroblastosis, since it is found in 90 per cent of the disease. However, it should not be used as final proof; otherwise it may lead to inclusion of cases which have nothing to do with erythroblastosis, with resulting confusion. No student of the subject will deny that there are instances of hemolytic anemia of the newborn or of severe jaundice or of hydrops which are not

Pathogenesis of fetal erythroblastosis. Principle: Rh positive husband of Rh negative woman transmits the Rh factor to the fetus. Rh antigenic substances pass from Rh positive fetus through placenta and produce in mother Rh antibodies. The latter pass from mother to fetus through placenta, act in the fetus as hemolytic agents and start the sequence of interlocking pathologic changes as presented in this chart.

erythroblastosis fetalis. Septic infections and prenatal and neonatal bronchopneumonia may be associated with severe hemolytic anemia and occasionally with jaundice. It is sometimes extremely difficult to diagnose the underlying infection clinically. Only a necropsy may reveal it. There are instances in which even necropsy findings may not be unequivocal, for instance in premature infants and in stillbirth, especially in the presence of advanced maceration. The diagnosis of erythroblastosis may be difficult also in mild abortive cases. In all such cases a study of the Rh factor in the parents and child and of anti-Rh agglutinins in the mother may be of considerable help in arriving at a correct interpretation.

A few instances which illustrate the role of tests for the Rh factor in obscure cases have been reported previously.³

The occasional need of differentiating fetal erythroblastosis from congenital malformation of bile ducts is demonstrated in the following case:

CASE 11.—An infant aged 11 days, a patient of Dr. Philip Aries, was admitted with a story of progressive jaundice starting on the third day of life and of severe anemia. The infant was born at term, the delivery was normal and the weight at birth was 8 pounds 14 ounces (4,025 Gm.). There were two previous children, 11½ and 6 years old, both normal since birth.

A few days after birth it was noticed that the stools were acholic and contained no bile or urobilin. The urine contained

completely. Bile in the urine decreased gradually and eventually disappeared. The response of the anemia to blood transfusions is shown in table 2.

There is no doubt that this was a case of erythroblastosis. It is possible that the biliary obstruction was due to a plug of thick inspissated bile, which is known to have a thick consistency in hemolytic jaundice. Probing of biliary passages by the surgeon may have dislodged the plug and brought about drainage.

Temporary acholia of stools in newborn infants with severe jaundice lasting for several days and weeks is

10/28.....	4,700,000	17	1.0	22,500					

bile but no urobilin. The icterus index in the blood serum was 150 and there was a prompt biphasic Van den Bergh reaction. The blood findings are retorded in table 2. Other laboratory findings were reticulocytes 9.4 per cent, platelets 188,000, coagulation time four minutes, bleeding time three minutes.

The acholic stools, the absence of urobilin in the feces and urine and the presence of bile in the urine prompted the diagnosis of obstructive jaundice probably due to congenital atresia of the bile ducts.

The anemia, erythroblastemia and jaundice suggested the possibility of fetal erythroblastosis. The mother was found to be Rh negative and her serum contained anti-Rh agglutinins. The baby, the father and the 2 older children were Rh positive.

An exploratory operation was decided on. The bile ducts were found patent. Within a few days following the exploratory operation bile appeared in the stool and urobilin in the urine; the jaundice began to decrease and soon disappeared

known to occur and has been quoted in the literature as leading to the erroneous diagnosis of congenital obliteration of bile ducts. Three views have been advanced as explanations: As a result of excessive hemolysis the bile becomes too viscoid to pass freely along the bile channels, the bile coagulates and forms bile thrombi and, thirdly, damaged liver cells overtaxed by excessive excretory work fail to function.

The case to be reported now illustrates a diagnostic problem of similar nature as in the preceding but where a study of the Rh factor did not help:

CASE 13.—A girl aged 4 days, a patient of Dr. B. M. Gaul, was admitted with a history of jaundice since birth, two blood counts showing 2,800,000 and 3,000,000 red cells and 55 and 60 per cent hemoglobin. The mother had one previous miscarriage. The child was A Rh positive and was given 165 cc. of A Rh negative blood, following which her red count went

up to 5,000,000, the hemoglobin to 23 Gm. The color index was 1.3, white blood cell count 22,000, stab cells 2 per cent, segmented leukocytes 78, eosinophils 2, basophils 1; nucleated red blood cells were present: 230 per cubic millimeter on the seventh day and 600 on the twelfth, none later. The red count remained normal without further transfusions, hemoglobin decreased gradually to 18 Gm., the white blood cell count to 14,000. The differential count showed a gradual decrease of segmented granulocytes: 61, 49, 46, 32 and eventually 29 per cent at the age of 20 days, with a corresponding rise in percentage of lymphocytes, thus assuming the normal pattern. A few days after birth it was noticed that the stools became acholic and showed no bile and no urobilin until the twenty-seventh

normal. At the time of writing, the child is 6 months old and perfectly normal.

The severe jaundice and the anemia at birth favor the diagnosis of erythroblastosis of the type in which the Rh factor is not involved.

One of the important consequences of the discovery of the Rh factor has been its practical application to the treatment of fetal erythroblastosis. There seems little doubt that transfusion of Rh negative blood administered early and continued according to clinical indications constitutes an important improvement in the treatment of the disease. In the following case reports

Urine: Fourth day, bile +; 5th day, bile +, urobilin and urobilinogen + in dilution 1:10; 14th day, platelets 238,000.

day of life, when doubtful traces began to appear. The urine showed bile pigment. Urobilin was present during the first two weeks of life, then absent, to reappear again in the fourth week. The icterus index on the twelfth day of life was 160, with a biphasic Van den Bergh reaction. It was 110 on the seventeenth day, 43 on the twenty-seventh, the Van den Bergh remaining biphasic. On the day of discharge at the age of 38 days the icterus index was 21.

The clinical diagnosis was fetal erythroblastosis or congenital anomaly of the bile ducts. The father was A Rh positive, the baby A Rh positive, the mother O Rh positive, without anti-Rh or any other irregular agglutinins. In spite of this negative serologic finding the diagnosis of fetal erythroblastosis was maintained and the child not operated on. It improved gradually, the jaundice disappeared and the stools became

the beneficial effect of transfusions is emphasized by the circumstance that the anemia in the surviving child was much more severe than in the one that died.

CASE 3a (patient of Dr. M. L. Dale).—The first child was normal and 2 years old when the second child was born. During pregnancy a transient anemia (red blood cell count 2,900,000 and hemoglobin of 65 per cent) were found on one occasion. The delivery was normal. The child became jaundiced on the second day of life. One hundred cc. of blood of group O, the Rh factor of which was not determined, was given but only a short while before death. Blood findings on the third day of life are recorded in table 7. Blood platelets were 190,000 on two occasions. Fragility of the red blood cells was normal. The child died on the fourth day of life. The necropsy findings are given in table 8.

CASE 3b.—The third child of the same family was born twenty-one months after the second. Pregnancy and delivery were normal. Birth weight was 8 pounds 4 ounces (3,742 Gm.). In view of the previous history of erythroblastosis, an Rh negative donor was available at birth (the hematologic data are given in table 3). The baby was B Rh positive, the father O Rh positive, the mother B Rh negative. The mother was examined repeatedly during pregnancy but did not show anti-Rh agglutinins, and none were found on repeated examinations after the birth of the child. Jaundice became manifest ten hours after birth but was probably already present at birth because the placenta was yellow. There was general edema involving the face, arms, abdomen, scrotum and legs. In addition to blood transfusions, treatment included 5 per cent glucose intravenously, calcium gluconate and vitamin K. The child was kept in an

liver was not palpable. The father was A Rh positive, the mother A Rh positive, with severe anemia and excellent response to blood transfusions (table 4).

That fetal erythroblastosis may occur without anemia and erythroblastemia is demonstrated in case 7 (patient of Dr. B. E. Sayre).

The first child was O Rh positive, 18 months old and was normal. In the present, the second, child jaundice was noted at the end of the first day. Pregnancy and delivery were normal. The father was O Rh positive, the mother O Rh negative, with anti-Rh agglutinins, the baby O Rh positive. The child was taken off the breast at the end of the first day. The liver and spleen were palpably enlarged. The temperature was 104 F. The child appeared lethargic, the face edematous.

oxygen tent until nucleated red blood cells disappeared from the blood. The weight on discharge was 11 pounds 2 ounces (5,046 Gm.). The laboratory data are given in table 3. The low total protein and the reversal of the albumin-globulin ratio are of interest.

The anemia was much more severe than that of the child that died. In addition there was general edema, which usually makes for a bad prognosis. The child was given 300 cc. of Rh negative blood during the first forty-eight hours, 230 cc. of it during the first twenty-two hours. Rh positive blood was not given until the twenty-ninth day of life. The child which died received probably Rh positive blood and only a short time before death.

The following is another instance of prompt response to transfusions of Rh negative blood:

CASE 15 (patient of Dr. Philip Aries).—The first child, aged 3½ years, was normal. The second child became jaundiced soon after birth. The spleen was slightly palpable; the

There was no pronounced anemia at any time. It is possible that anemia was averted by the transfusions of Rh negative blood. The jaundice decreased gradually. The fever subsided at the end of a week. Vaginal bleeding was noted on the fifth day, lasting two days. The patient was discharged after nineteen days, with the jaundice almost gone but irritability noted. The laboratory data and transfusion record are given in table 5. The child was readmitted at the age of 6 months. She had not been normal since she left the hospital. She was unable to hold her head erect. There were opisthotonos, a fever of 106 F., twitching, then coma. Lumbar puncture showed normal spinal fluid. Death occurred twenty-four hours after admission, from bronchopneumonia. The necropsy findings are given in table 8. At necropsy the liver showed no gross or microscopic abnormalities. The spleen, which was not enlarged, showed hemosiderosis. The absence of microscopic histologic changes in the liver is interesting. It is possible that at birth the histologic structure of the liver was similar to that seen in the other cases of the disease, in all of whom characteristic

changes were found as recorded in table 8. Purpura was the cause of death in 3 children of the same family, 2 of them twins.

CASE 8 (patient of Dr. A. H. Levine).—The first pregnancy terminated in abortion in the third month. The second pregnancy and delivery of a boy were normal. Jaundice was noted on the third day, followed by listlessness, twitchings and rapid decline and death on the fourth day. The platelet count was 180,000, the coagulation time four minutes, the bleeding time two minutes. Other hematologic data are given in table 6 and the necropsy findings in table 8.

CASES 9 and 10.—Twins were born to the mother of patient 8 about fourteen months later, after a normal pregnancy and uneventful delivery. Jaundice was noted soon after delivery. There was no response to blood transfusions. The father was

of Rh positive, but the latter was given only to babies 11 days old or older. The surviving babies received together 1,810 cc. of blood. The beneficial effect of transfusions and especially of Rh negative blood when administered early is evident.

Necropsies were done on 8 babies with erythroblastosis (table 8). Two had congenital hydrops, 1 a premature stillborn weighing 970 Gm., the other stillborn at term, weighing 2,800 Gm. They were the only 2 in the series without jaundice, although the larger showed biliary stasis in the liver. Jaundice may have been obscured by edema. Three were 3 days old, 2 were 4 days old and 1 was 6 months old at death. There was a history of familial incidence in 5 of them. Two

† Ratio of weight of placenta to body normally about 1:7.

O Rh positive, the mother O Rh negative with anti-Rh agglutinins, baby 1 (a girl) O Rh positive, baby 2 (a boy) O Rh positive. The hematologic data are given in table 6, the necropsy findings in table 8.

An attempt was made to correlate the anemia in the first blood count and the transfusions with the outcome (table 7). The red counts in millions in those that survived were 1.1, 1.5, 1.6, 1.9 and 2.8 and in those that died 2.7, 2.8, 3.6, 4.1, 4.3 and 4.7. The apparent relation between the severity of the anemia and the outcome may be purely accidental in the small series. The effect of transfusions is evident from the following figures: The 5 infants that died received altogether 110 cc. of Rh positive blood, 230 cc. of Rh negative blood and 20 cc. of probably Rh positive blood, together 360 cc. of blood. The 6 children that survived (among them is included child 7, which lived six months) received 1,200 cc. of Rh negative blood and 610 cc.

were the second children in the families, the first having been normal. One was the first live born child, preceded by an abortion. In addition to the 2 previously mentioned with severe general hydrops, 3 had moderate local edema and 3 had no edema. Six had severe jaundice of icterus gravis type. Only 1 had an enlarged liver, 150 Gm., with a body weight of 2,640 Gm. The normal weight would be about 106 Gm. In some of the others clinical records referred to palpably enlarged liver. In case 7, necropsy at the age of 6 months showed a liver actually smaller than normal, 136 Gm. as compared with 200 according to body weight of 6,000 Gm. All except case 7 showed microscopic changes (hemopoiesis, hemosiderosis and biliary stasis) in the liver. The child listed as case 7 died at the age of 6 months. That circumstance may be responsible for absence of changes in the liver. Five had spleno-megaly, all 8 showed microscopic changes in the spleen

(hematopoiesis and hemosiderosis), 6 showed focal hemopoiesis in other organs, including the kidneys and adrenals. There was nuclear jaundice in the brain in 4. The placentas were examined in only 4, and all were enlarged. Two with considerable enlargement (relation of weights of placenta to body was 1:1.3 and 1:1.7 instead of the normal average of 1:7) showed characteristic microscopic changes (fibrosis, edema, hemopoiesis). The other 2 with moderate enlargement (1:3.7) showed no microscopic abnormalities.

PATHOGENESIS OF FETAL ERYTHROBLASTOSIS

The diversity of findings in fetal erythroblastosis becomes less bewildering when viewed against the background of the genesis of its manifestations. The accompanying diagram attempts to give a genetic concept based on Levine's hypothesis that passage of Rh antibodies from an Rh negative mother to the Rh positive fetus is responsible for the hemolytic anemia in the latter. All the other manifestations are logical sequelae in keeping with our knowledge of similar changes in other conditions. This concept was developed in greater detail in a previous publication.² The damage of the liver is placed in the center of the picture, the hemolytic anemia and anoxemia being the fundamental preliminary changes, the other changes resulting from it. The arrows show the course and sequence of events.

There still remains the question why children with various manifestations of the disease are born in the same family. How can it be explained that 1 child has congenital hydrops, another congenital anemia and the third icterus gravis? The order is not necessarily from the least severe form (anemia) to the most severe (hydrops). Four points attempt to answer this question:

CONDITIONS INFLUENCING SEVERITY OF FETAL ERYTHROBLASTOSIS AND ITS MANIFESTATIONS

1. Age of fetus when Rh antibodies begin to act on it.
2. Length of time during which fetus is exposed to such action.
3. Strength of Rh antibodies of which the titer of anti-Rh agglutinins in the blood of the mother may or may not be a measure. There is evidence available suggesting that there is no direct relation between the titer of these antibodies in the mother and the severity of the disease in the baby. However, this needs to be investigated on larger material.
4. Permeability of the placenta. It is possible that there are quantitative differences in different women and at different times even in the same woman.

CONCLUSIONS

Hemolytic anemia due to the action of Rh antibodies is not only the initial cause of fetal erythroblastosis, but it explains the genesis of the complex manifestations of the disease. Damage of hepatic parenchyma is the fundamental change.

The finding of the characteristic distribution of the Rh factor (father and child Rh positive, mother Rh negative) may be used as corroborative evidence favoring the diagnosis of erythroblastosis, but it should not be used as such to the exclusion of other diagnostic criteria. The supportive evidence is greater when anti-Rh agglutinins are found in the Rh negative mother.

ABSTRACT OF DISCUSSION

DR. A. G. FOORD, Pasadena, Calif.: Dr. Fisk in our laboratory demonstrated that the blood of all newborn babes is Rh positive if antiserum produced in guinea pigs by injection of monkey blood is used for the tests. Consequently serums of human origin are essential, and several serums should be used, all of which should be tested against sufficient bloods to determine their subtype. Recently we had the problem of studying a physician's wife who was pregnant. She had had one normal child and then one stillborn with hydrops, at which time she had weak anti-Rh agglutinins in her blood. During this, her third, pregnancy we examined her blood for anti-Rh agglutinins at various intervals, including just before delivery, and were never able to demonstrate any agglutination of Rh positive red cells from several adult persons. She delivered an anemic, full term, living baby with all the findings of erythroblastosis. Multiple transfusions from Rh negative donors saved the child. We had saved the serums from the mother and repeated the agglutination tests with cord bloods obtained from newborn infants. By this method agglutinins were easily demonstrated. I have no explanation for this phenomenon, but as a certain number of women who have delivered babies with erythroblastosis become pregnant subsequently the demonstration of anti-Rh agglutinins in these women's bloods can best be done by using cord bloods.

DR. ISRAEL DAVIDSOHN, Chicago: Dr. Foord reveals a source of false positive tests if an anti-Rh guinea pig immune serum is used. With such serum the blood of all newborn babies is Rh positive, whereas with human anti-Rh serum the incidence of Rh negative reactions in the blood of newborn babies is similar to that in adults. For the present, human anti-Rh serum is preferable for clinical work. It is advisable to use three immune serums, differing in their specificity. At least one of them should react with about 85 per cent of the population. False results are dangerous. A false positive result may prompt use of an Rh positive donor for an Rh negative recipient and be responsible for a transfusion reaction. False negative results may lead to selection of incompatible donors and also to a wrong conclusion in the interpretation of a so-called bad obstetric history. One may be able to prognosticate to some extent regarding the probable occurrence of erythroblastosis in future pregnancies, by examining all living children. If one of them is Rh negative, the father is heterozygous Rh positive and his children have an even chance to be Rh positive or Rh negative. The Rh negative children will be free of erythroblastosis, at least as far as it is due to the Rh factor. Similar information is sometimes obtainable by examining the husband's parents. If one of them is Rh negative the inference is justified that the husband is heterozygous Rh positive. The relation between the Rh factor in the baby and erythroblastosis has been dramatically illustrated by several reports of erythroblastosis in Rh positive infants, while the Rh negative twins were free of disease. The best time to test for anti-Rh agglutinins in the blood of mothers of babies with erythroblastosis is not immediately after delivery but about ten days later. It is probable that, until birth, there is an interchange of antigenic substances and antibodies between mother and baby. The baby's antigenic substances may neutralize the specific antibodies in the blood of the mother. This explains the higher titer, after an interval of from ten to fourteen days since delivery, when possibility of neutralization has been eliminated.

Earliest Medical Reference Relating to a Miner.—The earliest medical reference which may be interpreted as relating to a miner is to be found in the *Corpus Hippocraticum*. In the fourth book of *Epidemics* the following case history is to be found: A man from the mines had the right hypochondrium distended. His spleen was enlarged, and his abdomen was distended and hard. His respiration was labored, and he was both pale and livid. The disease then attacked the left knee. There was a relapse in the entire body and finally a crisis.—Rosen, George: *The History of Miners' Diseases*, New York, Schuman's, 1943.

ADMINISTRATION OF PENICILLIN
BY MOUTH

PRELIMINARY REPORT

The view is generally held that when given by mouth penicillin is destroyed by stomach acid and in consequence only very small amounts can be detected in the urine.¹ In contrast, when given by intravenous or intramuscular injection, urine recoveries of penicillin were reported to average approximately 60 per cent.¹ Combined administration of penicillin and sodium bicarbonate was followed by the appearance of penicillin in the blood. The detectable levels were, however, found to be very low.² In subjects suffering from achlorhydria accompanying pernicious anemia the urinary excretion of penicillin given by mouth reached relatively high figures with appreciable blood levels (up to 40 per cent).²

In the light of all these observations, Charney, Alburn and Bernhart³ studied penicillin excretion through the kidneys after combined administration of penicillin and buffer salts with a buffering range not reaching alkaline p_H values. It is known that penicillin is sensitive not only to acid but also to alkaline reaction. Thus the use of sodium bicarbonate or similar alkaline antacids was considered undesirable and unpractical.

Trisodium citrate was found by Charney, Alburn and Bernhart to be a suitable buffer with the proper buffering range. Administration of 1.0 to 5.0 Gm. of trisodium citrate and 20,000 to 30,000 units of penicillin (both dissolved in 200 to 400 cc. of water) by mouth given two hours after breakfast resulted in appreciable increase of the urinary excretion of penicillin when compared with control experiments in which no buffer was used. The figures for urinary excretion of penicillin given by mouth on a fasting stomach were only slightly increased by the simultaneous administration of buffer and were higher than in the experiments in which penicillin was given after breakfast.

The results of these investigations stimulated the extension of the studies in the clinical field with special reference to the therapeutic possibilities, and the blood

levels of penicillin when given by mouth with and without buffer (sodium citrate).

Figures of urinary excretion of penicillin are not an accurate yardstick of the therapeutic effect penicillin might exert while passing through the body. On the other hand, the fact that penicillin given by mouth appears in the urine proves that it is absorbed from the gastrointestinal tract.

Gonorrhea offered the best approach for the therapeutic evaluation of penicillin when given by mouth. The rapid cure of gonorrhea by injected penicillin gave a reliable basis of comparison. If it is effective at all, rapid therapeutic effects would be expected after oral administration of penicillin. Even an unsuccessful attempt would cause no significant delay or harm and could be quickly followed by well established therapeutic procedures.

THE TREATMENT OF GONORRHEA

Table 2 contains the summary of observations on 18 male adults and on 5 children (girls, 3 weeks to 6 years) in whom gonorrhea was treated with penicillin given by mouth. The majority of these cases was resistant to sulfonamides. The doses of penicillin

varied from 10,000 units (every three to four hours) in children to 15,000 to 40,000 units (every three hours) in adults for two to three days in combination with trisodium citrate (1 to 5 Gm. per dose). In all these cases cure was achieved in one to three days and with doses which appear to be comparable to, and not out of line with, the customary doses of penicillin when given by injection. It appears, therefore, that penicillin, at least in combination with a buffer such as sodium citrate, is an effective therapeutic agent against gonorrhea, even when given by mouth.

The amounts of penicillin and of sodium citrate used as well as the type of buffer salt may undergo modifications in the future, depending on the outcome of continued and extended investigations. In this connection, observations made on 3 girls (2 to 5 years) not included in table 2 are important. In these 3 patients the administration of 10,000 units of penicillin (every four hours) given with 1 or 2 Gm. of sodium citrate with a total dose of 200,000 to 300,000 units was followed by prompt but only temporary clinical cure of the gonorrhea. The treatment was repeated twice with identical temporary results. The same doses of penicillin given intramuscularly (every three hours) resulted in permanent cure in these 3 children. Thus, either the doses were too low in oral administration or the oral treatment should have been continued over a longer period and with perhaps

This paper was presented, in abbreviated form, by one of us (P. G.) on Dec. 5, 1944 at the postgraduate course in internal medicine (Pediatric Section) of the American College of Physicians, Philadelphia.

The penicillin was provided by the Office of Scientific Research and Development, from supplies assigned by the Committee on Medical Research for experimental investigations recommended by the Committee on Chemotherapeutics and Other Agents of the National Research Council.

administration at shorter intervals. It is of interest to note that these relapses on oral medication occurred in chronic gonorrhea in young girls, whereas gonorrhea in adults seemed in these studies to present less difficulties.

Penicillin, in combination with sodium citrate, given by mouth, caused rapid and permanent cure of gonorrheal conjunctivitis in 3 treated infants (aged 7, 17 and 40 days). The doses used were 10,000 units of penicillin and 1 Gm. of sodium citrate every three to four hours with a total dose of 140,000, 180,000 and 200,000 respectively. The effect was always very prompt and smears became negative after three to four doses.

TREATMENT OF OTHER DISEASES

In a 7 year old girl with nonspecific streptococcal vaginitis penicillin (10,000 units) with 2.0 Gm. of sodium citrate every three hours given by mouth in

organisms were seen and in thirty hours dark field examination was completely negative. At the end of the second day treatment was changed to the standard scheme of intramuscular administration.

All the foregoing preliminary and scattered observations support the conclusions that, even apart from gonorrhea, penicillin given by mouth, in combination with a buffer salt such as sodium citrate, can and does exert a beneficial therapeutic effect comparable in speed to parenteral administration.

In the light of these clinical results the figures for urinary excretion of penicillin gain more practical significance. In this connection it should be noted that, according to a recent publication⁵ which appeared after the present clinical and experimental studies were concluded, 8 to 33 per cent of 100,000 units of penicillin given by mouth to normal human subjects, without added buffer, was found to be excreted in the

* Received only 2 Gm. of sodium citrate with each dose of penicillin.

† Received only 1 Gm. of sodium citrate with each dose of penicillin

a total dose of 200,000 units was followed by rapid and permanent cessation of discharge.

In a 3 year old boy suffering from chronic otitis media with perforation and suppuration (hemolytic streptococcus) treatment with sulfathiazole (an initial dose of 2.0 Gm. and then 0.5 Gm. every four hours for twenty-three days) was of no avail. Penicillin combined with 2.0 Gm. of sodium citrate given by mouth 10,000 units every three hours for twenty doses brought about complete cure, as evidenced by complete disappearance of discharge.

In 1 patient with early acquired syphilis and positive dark field examination⁴ the combined administration of penicillin (30,000 units every three hours) and sodium citrate (5 Gm. per dose) by mouth did not differ in its result materially from that which ordinarily follows parenteral administration of penicillin. Treponema pallidum decreased in number at eighteen hours. At twenty-four hours only a few distorted

urine. Simultaneous administration of sodium bicarbonate had decreased the figure for urinary excretion, probably because of destruction of penicillin in the alkaline medium of the gastrointestinal tract.

It was expected that valuable information could be gained from following the blood level figures for penicillin after oral administration. Such blood tests taken in hourly intervals after ingestion of penicillin will also illustrate the shape of the blood penicillin curve and its duration.

Among the methods advanced for the assaying of small quantities of penicillin in body fluids are those proposed by Rammelkamp,⁶ Wilson⁷ and Rake and Jones,⁸ which differ somewhat in detail but are all

⁴ This observation was kindly put at our disposal by Dr. H. N. Cole and Dr. G. W. Binkley, University Hospitals, Cleveland.

based on the inhibition of hemolysin production by a selected strain of streptococcus.

The sample protocol (table 1) illustrates the procedures used in these investigations.

The following modifications were incorporated in our procedures:

1. The total volume of serum required was more than in other methods, but a greater accuracy was obtained.

2. The broth used consisted of 2 per cent Difco Tryptose, 1 per cent neopeptone, 0.85 per cent sodium chloride, pH 7.2.

3. The test organism was a group A hemolytic streptococcus, number C203, grown for eighteen to twenty hours on 1.0 per cent horse serum agar of the foregoing medium. The organisms were washed twice with 0.85 per cent saline solution to remove all traces of hemolysin. A final inoculum of from 5,000 to 10,000 organisms per tube was sufficient.

4. Initial tests indicated a lysis of both rabbit and sheep erythrocytes by complement in the serum samples. Substitution of human type O erythrocytes worked very satisfactorily.

5,000 to 10,000 streptococci, giving a final volume, with the 1.0 cc. serum dilution, of 2 cc. per tube.

6. Incubation at 37 C. proceeded for sixteen to eighteen hours.

7. Initial readings were made without shaking the tubes. After thorough resuspension of the erythrocytes and two additional hours of incubation, final readings were made. Complete hemolysis in tubes containing insufficient penicillin was the usual rule. Incomplete hemolysis at the second reading in 1.0 cc. serum tubes, in comparison to complete hemolysis in the standard series, was considered as indicative of a trace of penicillin, although, if allowed to incubate longer, such tubes eventually showed complete hemolysis. In agreement with Rammelkamp, the tubes showing no hemolysis were sterile.

8. Potencies were obtained by multiplication of the lowest unitage of standard penicillin showing a negative tube times the conversion factor of the smallest volume of active sample as in the protocol; i. e., $0.02 \times 10 = 0.20$ unit of penicillin per cubic centimeter of serum.

The possibility of Rh interference exists but is remote. An alternative method, using sheep erythrocytes, which may be used if human cells are not available, is to heat serum samples in a water bath at 56 C. for five minutes. Control series of standard penicillin in human serum, with or without complement, and in plain broth, demonstrated no destruction of penicillin by this treatment.

No evidence was found in any series of heated or unheated serums against human or sheep erythrocytes, controlled by broth dilutions of standard penicillin, to support the contention of Holmes and Lockwood⁹ that human serum contained an antipenicillin factor.

With respect to the high incidence of complement interference in these assays it must be borne in mind that the tests were made on children, in whom the incidence of occurrence of high titer complement may possibly be greater than in adults.

5. The inoculum consisted of 1 cc. of 4 per cent erythrocytes, washed twice with isotonic solution of sodium chloride and

The sample protocol may be extended to include more than 1 unit by diluting serum 1:50 and using volumes decreasing by 0.1 cc. quantities.

With the method used 0.02 unit per cubic centimeter was accurately determined. "Trace" signifies levels between 0.01 and 0.02 unit per cubic centimeter.

In this group of experiments, penicillin calcium was used either in the form of the usual dry preparation in bottle or in the form of tablets especially made up with trisodium citrate (1 Gm. of sodium citrate with 10,000 units of penicillin calcium in one tablet¹⁰). Each day 2 children of closely similar age and weight received 40,000 units of penicillin, one in the form of a tablet with buffer dissolved in water and the control without buffer in freshly prepared aqueous solution. The results are summarized in tables 3 and 4. When penicillin was given by mouth thirty minutes before breakfast, sodium citrate administered simultaneously increased the abso-

lute blood levels and also prolonged the presence of penicillin in the blood. Penicillin could be detected in the blood (with one exception) four hours after ingestion, whereas it is a rarity to find penicillin in the blood even three hours after intramuscular injection of aqueous penicillin solution.¹¹ When penicillin was ingested after overnight fasting and four hours before the first meal, the effect of the buffer salt was less pronounced but still significant.

The investigations on blood levels of penicillin following its oral administration are being continued under varied experimental conditions. However, the results so far obtained allow a generalization, i. e. ingested penicillin reaches the circulation in therapeutic concentration and in prolonged flow from the intestine.

CONCLUSIONS

1. Penicillin given by mouth in combination with a suitable buffer salt, such as trisodium citrate, was found to be therapeutically effective in a number of cases of gonorrhea and other diseases.

2. The effective doses were comparable to the doses routinely used in parenteral administration.

3. Combination of penicillin and sodium citrate given by mouth produces greater and more prolonged increase of penicillin blood levels than penicillin ingested without a buffer salt.

CURARE IN ANESTHESIA

HAROLD R. GRIFFITH, M.D.

MONTREAL, CANADA

Good muscular relaxation is one of the requirements for efficient abdominal surgery, and in order to obtain this relaxation surgeons and anesthetists have sometimes used anesthetic drugs and methods which are toxic or hazardous. The introduction of curare into clinical medicine has made it possible for us to obtain complete muscular relaxation at any time during anesthesia with nontoxic controllable anesthetic agents. After more than two years of careful clinical observation I have come to the conclusion that curare is a safe drug to use in combination with certain anesthetic agents, provided it is administered under properly controlled conditions.

The story of the transformation of this South American Indian arrow poison into an anesthetist's tool may be told briefly as follows: Curare has been known to science since 1595, when Hakluyt referred to it in his description of Sir Walter Raleigh's voyage up the Orinoco. In 1840 Claude Bernard,¹ in a series of famous physiologic experiments, confirmed the observations which Watterton and Brodie had made in 1814, that curare action was paralysis due to interruption of the neuromuscular mechanism. The drug therefore became of value in the physiologic laboratory for the study of muscle activity without interference from nervous impulses. Clinicians had more than once cast hopeful eyes toward the possible use of curare in the treatment of spastic disease of the muscles, but always its poisonous reputation and the presence of cardiac depressants and other adulterants in the available sup-

plies made a clinical trial seem too dangerous. No one knew the exact botanic sources of curare or the chemical composition of its active principle. In 1938 Richard C. Gill,² an American who had lived for years in the upper Amazonian jungles of Ecuador and who was familiar with the Indian folklore and mysticism which has surrounded the "flying death," as curare is called in the jungle, brought back to the United States the first adequate supply of the drug with properly labeled specimens of the various plants which are used by the Indians in the manufacture of crude curare. Professor A. R. McIntyre³ of the University of Nebraska then subjected this supply of curare to the first pharmacologic study by modern methods. Through cooperation with the Research Laboratories of E. R. Squibb and Sons a purified product was produced which exhibited the true curare action without toxic side effects and which seemed safe for human experimentation. The present commercial product, which is known as "Intocostein" (Extract of Purified Curare, Squibb), is marketed in 5 cc. vials of a pale amber liquid which contains 20 mg. of active curare substance to each cubic centimeter. It is obtained from the single plant *Chondrodendron tomentosum* and has a selective action affecting first the muscles of the throat and neck, then the skeletal muscles of the extremities, chest and abdomen, and the diaphragm last or not at all. It has no effect on involuntary or cardiac muscle in therapeutic doses.

The first large scale test of the new curare on human subjects was made by Professor A. E. Bennett⁴ of the University of Nebraska, who used it to soften the traumatic effects of convulsive shock therapy in psychiatric patients. This use for curare in conjunction with both metrazol and electric shock therapy has become widespread in mental hospitals, and now many thousand injections have been given without harmful effect. With this pharmacologic and clinical evidence of the safety of "Intocostein" we felt that it might be tried on patients under general anesthesia, and so at the suggestion of Dr. L. H. Wright of New York we began using it in patients under cyclopropane anesthesia at the Homeopathic Hospital of Montreal in January 1942. The results obtained were dramatically successful, but we proceeded cautiously until we became fairly sure that there were no postoperative effects to worry about, and it seemed advisable to publish a preliminary report⁵ and to seek confirmation of our results by other workers. The reports which have been published and which have been communicated to me personally by many anesthetists are unanimous that curare has a useful place in anesthesia, and that its use appears to be safe. The most convincing and valuable work which has been done is that of Dr. S. C. Cullen⁶ of the State University of Iowa, who has been using curare routinely in abdominal surgery since 1942 and who has now reported over 1,000 successful administrations. I myself have administered curare only 300 times, because I have preferred to give it only to those patients who need extra relaxation and,

as I will show in my statistics, that is in a comparatively small proportion of our total cases.

I do not propose in this clinical report to discuss the physiologic and pharmacologic action of curare. It is sufficient to state that it acts on the neuromuscular synapse probably by neutralization of the acetylcholine reaction. It effectively blocks synaptic transmission between preganglionic and postganglionic fibers of the sympathetic division of the autonomic nervous system. Curare is eliminated very rapidly, partly by destruction in the liver and partly by excretion unchanged by the kidneys. No evidence of any visceral damage has been produced and no direct effect on the heart reported. It may apparently be given to patients with damaged liver or kidney without any prolongation or intensification of the effect. We have used it on some very poor risk patients quite harmlessly, although the patients for whom it is most needed for relaxation are healthy muscular individuals. Respiratory depression may occur following curare injection and has been noted in about 10 per cent of our cases. However, this is always transitory and may easily be controlled by the same methods which we employ to control respiratory depression occurring from other causes during anesthesia. An overdose causing complete respiratory paralysis can be overcome by artificial ventilation of the lungs with oxygen during the ten or fifteen minutes of paresis. Neostigmine bears a close resemblance to a true physiologic antidote to curare, since it acts to inhibit cholinesterase and restore the acetylcholine preponderance at the myoneural junction. For this reason an ampule of neostigmine should always be available when curare is used, although in our experience it has never been necessary to use it.

Most of the patients to whom I have administered curare have been undergoing abdominal operations under cyclopropane anesthesia. For years I have found cyclopropane unmixed with ether to be generally satisfactory for abdominal surgery, and I have used it in a much larger proportion of cases than do many other anesthetists. I myself have administered cyclopropane over 10,000 times and have been lucky enough to have all these patients leave the operating room alive, but I must admit that there are times when it is difficult to secure complete muscular relaxation with cyclopropane alone. Since we have had curare we do not try to push a resistant patient into deep anesthesia with cyclopropane; but at the first evidence of inadequate relaxation we make an intravenous injection of curare. This takes effect within a few seconds and is usually sufficient when combined with cyclopropane to maintain relaxation as long as it is required during the operation. The duration of the effect of a single dose of curare when not combined with cyclopropane or other anesthetic agent is not more than fifteen or twenty minutes. The accompanying table shows the incidence of our use of curare in 1,000 consecutive operations. It is noted that curare is, as might be expected, more often needed for upper abdominal and for pelvic surgery than for ordinary appendectomies, and in the extra-abdominal cases it has been employed usually to facilitate endotracheal intubation.

There have been some differences of opinion between various workers as to the proper dose of curare to be used for patients under anesthesia. All are agreed that it is best given intravenously, although intramuscular injections are used for the treatment of patients with spastic disease and "Intocostrin" is not irritating to the subcutaneous tissues. The intravenous route secures the most rapid and controllable effect for our purpose. Cul-

len, and more recently Baird and Adams⁷ of the Mayo Clinic, recommend an injection of 2 to 3 cc. of "Intocostrin" after the skin incision is made, to be repeated if muscular relaxation is not satisfactory. My routine has been somewhat different. To the average adult patient I usually give a dose of 5 cc. of "Intocostrin" (100 mg. of curare) in one intravenous injection. This has proved to be adequate in almost every case and has had no harmful effect in any case except occasional respiratory depression, which, as I have said, is easily controlled. It is a simpler method than to give fractional doses according to the patient's requirement, as recommended by Cullen. Too small a dose will lead to disappointing results, as was the case with some of the earlier investigators—it is the old story of sending a boy on a man's errand. The doses being used in psychiatry for the minimizing of convulsion trauma are smaller than we recommend in anesthesia, but I believe that in the operating room with facilities always at hand for the control of respiration the conditions are safer for large dosage than in most mental hospitals. Our patients have varied in age from 12 to 75 years, and the dose should be reduced in proportion to the weight of a child or to factors of frailness and asthenia in the aged. Whether

curare can safely be used with babies and quite small children remains to be determined by those who work in that field. I have not used it in any case of cesarean section or obstetric delivery.

As I have said, almost all our patients have been under cyclopropane anesthesia with no added ether or other anesthetic agent. There is no doubt that curare works ideally in combination with cyclopropane. I think, however, that it may be used safely with other agents, particularly with nitrous oxide and ethylene. Cullen has shown that with ether the dose of curare should be reduced to one third of that usually used during cyclopropane anesthesia. Experimental studies have shown that this is because ether itself has a pronounced curariform action and that the myoneural junction is already partially paralyzed. If this factor is kept in mind curare may be used satisfactorily during ether anesthesia, and relaxation and a quiet abdomen obtained without deep anesthesia.

I have used curare in conjunction with sodium pentothal in only 1 case, but Dr. Fernando Hudon of Quebec, who uses pentothal for much abdominal surgery, has obtained excellent results with the combination of "Intocostrin" and pentothal in a fairly large series of cases.⁸ There seems to be no significant change in respiration and pulmonary ventilation with this combination.

7. Baird, J. W., and Adams, R. C.: Curare in General Surgery, Proc. Staff Meet., Mayo Clin. 19:193, 1944.
8. Hudon, F.: L'emploi du curare comme adjuvant de l'anesthésie générale, Laval méd. 9:242, 1944.

Preoperative medication does not seem to have any effect on curare action. Cullen has stated that atropine or scopolamine is apparently essential in the premedication. Our experience has not borne out this theory, as at least half of our patients have received neither of these drugs, and I can see no difference in the curare action. Nor have we had any special difficulty with hypersecretion of mucus which might be attributed to curare. About 10 per cent of our curare patients received a moderate dose of solution of tribromoethanol previous to cyclopropane, and here again there has been no significant change in the curare effect. The complete absence of all postoperative effects from curare has been one of the most striking and encouraging features of this whole investigation.

Much more clinical and laboratory experience will be needed before we can come to any conclusion as to the permanent place of curare in anesthesiology. However, in view of our experience so far I venture to predict that it will have some effect in reducing the incidence of spinal anesthesia, since the indication for many spinal anesthetics is in order to obtain abdominal muscular relaxation; and also that curare will increase the use of pure cyclopropane or pentothal anesthesia for abdominal surgery without the addition of ether and thus reduce postoperative complications. May I close with an urgent word of caution—curare is still a poison and, like every other poison, it should be handled intelligently and only by experienced physicians.

3445 Northcliffe Avenue.

ABSTRACT OF DISCUSSION

DR. STUART C. CULLEN, Iowa City: Although the first enthusiasm for the use of curare as a means of improving muscular relaxation has not yet reached its zenith, it appears likely that this drug, in the purified and standard form known as "Intocostin," will weather the discredit it will most assuredly receive from indiscriminate users and become a beneficial adjunct to the anesthetist's catalogue of drugs. It seems untenable that a drug with such a lurid history and with so potent an effect should be so incapable of producing acute or chronic damage. Extensive and painstaking investigation of this drug in the past has failed to disclose any injury to tissue except that resulting from asphyxia associated with unrelieved respiratory paralysis. Current clinical and laboratory research with the more purified form of curare has not altered the conception of any of the significant features of the action of the drug. These later inquiries have corroborated the innocuousness of the drug in its action on the heart, the peripheral circulation, the liver, the kidney and the striated muscle. This lack of positive findings does not, however, belittle the necessity for continued close scrutiny of the action of curare in the clinic and in the laboratory. It is still necessary to know its effect on the smooth muscle, its placental permeability, its effect on the constituents of the blood, its effect on cortical and medullary cells and its ultimate effectiveness in improving the anesthetic technic so that more patients will return home sooner and in better shape. With the exception of Dr. Griffith's technic of administration, I am thoroughly in accord with all that he has said. On principle, I object to the injection of the same dose to all persons of the same age or physical state without regard to the particular demands of the situation. There cannot help but be overdosage in some instances and underdosage in others. Fortunately, overdosage produces minimal hazard if one is prepared to combat the momentary respiratory paralysis, and no one should employ curare without being so prepared. The chief advantage of curare lies in the fact that its use permits the employment of relatively nontoxic and readily controlled anesthetic agents and technics. Any reduction in morbidity or mortality that may attend the use of curare during anesthesia will be only a reflection of the anesthesiologist's ability to adapt less toxic and more facile agents and technic to the more difficult anesthetic problems.

DR. J. W. BAIRD, Minneapolis: Although curare is a potent poison in large doses, it is proving to be a safe drug when used intelligently. Apparently there is but one absolute contraindication to its use: the inability of the anesthetist to perform artificial respiration adequately and thus successfully combat the respiratory failure which we at times encounter. This point cannot be too strongly stressed. If the drug is to fall into disrepute, I feel that it will be because the anesthetist has not availed himself of the proper apparatus and knowledge to treat the respiratory failures. Profound anesthesia is not used from choice, but rather from necessity, if we are to produce adequate muscular relaxation for abdominal surgery. The profound anesthesia is frequently as shock producing as the surgery itself; however, curare has to a large extent eliminated the necessity of the deeper stages of anesthesia and its accompanying dangers. If there is an advantage in the lighter planes of anesthesia—and I definitely feel that there is—I believe it is advisable to use the drug more or less routinely rather than to rely on it only for the occasional case in which difficulty is encountered in producing relaxation by the usual methods. Consequently we are seeing a better convalescence in the patient who has received curare and has been spared a long profound general anesthesia. Cyclopropane is perhaps the anesthetic agent of choice; although we have used the other anesthetic agents with no untoward results. My associates and I give curare in smaller, divided doses. By adhering to this technic we are avoiding the severe respiratory depressions we see when a large dose of the drug is administered. Granted that this depression is easily controlled by compressing the breathing bag on the gas machine, we feel that it is advisable to avoid this depression if possible and still successfully produce the muscular relaxation needed. Usually the greatest muscular relaxation is needed for opening and closing the abdomen and at the time of exploration. After the exploration is completed and the packs and retractors are in place, a high degree of muscular relaxation is usually unnecessary for good operating conditions. Frequently the initial dose of curare is adequate until the abdomen is to be closed. At this point a supplementary injection is made. However, a smaller dose of the drug is usually adequate for the closure. This dose is frequently 15 to 20 mg. smaller than the initial dose. In a survey recently made at the University of Minnesota Hospitals it was found that the average period of time between the first and second dose of the drug was seventy-five minutes. Another use we have found for the product is for the patient who is resistant to the anesthetic agents. This type of patient is usually heavy and muscular and frequently is a heavy drinker and smoker.

DR. H. R. GRIFFITH, Montreal: I gave the impression, perhaps, that I always use 5 cc. of "Intocostin." That is the usual dose for an average person. If a patient is small or frail, I sometimes go down to 2 or 3 cc. It is a somewhat easier technic to give 5 cc. (100 mg. of drug) in one dose than waiting to see if 2 or 3 cc. is effective and then giving another injection after one sees that the first is not sufficient. There is a question as to whether curare has any anesthetic action. Theoretically I would say no, and I would not recommend it to be used as an anesthetic in any way. There is some evidence, however, that curare in large doses may have an anesthetic action: at least it will produce unconsciousness. Dr. Rolland Whitacre of Cleveland tells me that he has some experience which shows that a patient can be put to sleep with curare alone if he is given enough, without any other anesthetic agent. But that isn't a technic of anesthesia that any of us recommend, and I know he doesn't. Curare is useful in difficult cases for bronchoscopy. A dose of curare for a perfectly conscious patient is a rather terrifying procedure, that is, an ordinary dose of 3, 4 or 5 cc. of "Intocostin," because he is not asleep and he gets a relaxation of his throat and neck, and he thinks he is going to die. But if you are going to do a bronchoscopy on a patient who is well sedated and who has also had curare he will have the bronchoscope in his throat anyway, and he won't have time to think about how unpleasant it is to have relaxation of the throat and neck. In the use of this agent, as well as any other agents or methods, the anesthetist is more important than the agent that is being used, and curare may be very dangerous in the hands of untrained personnel.

Clinical Notes, Suggestions and New Instruments

FULMINATING MENINGOCOCCEMIA (WATERHOUSE-FRIDERICHSEN SYNDROME)

AN UNUSUAL CASE WITH RECOVERY FOLLOWING TREATMENT
WITH PENICILLIN

J. M. HAYES, M.D., LOS ANGELES, AND
JOHN F. WHALEN, M.D., ALTADENA, CALIF.

The Waterhouse-Friderichsen syndrome is designated as a symptom complex characterized by purpura and shock associated with the postmortem findings of bilateral adrenal hemorrhage. Karsner¹ states that this syndrome may be caused by the streptococcus, pneumococcus or influenza bacillus. Boger² cites a case in which meningococci were demonstrated by direct examination of the peripheral blood smear. He states that this finding has been recorded as occurring only in fatal cases.

In this case the pathologist demonstrated meningococci in the smear after repeated examinations. Boger's report would indicate that this is the first surviving patient in whom the meningococcus was demonstrated in the peripheral blood smear.

Cosgriff³ states that with the increasing prevalence of meningococcal meningitis there was an associated rise in the number of cases of the so-called Waterhouse-Friderichsen syndrome. He cited 4 adult cases seen in the New York Presbyterian Hospital in the course of eight months. Up until 1942 only 103 cases had been reported, with apparently three recoveries. Ninety per cent of these were in infants or children under the age of 9 years. Cosgriff describes the postmortem findings as characterized by invariable hemorrhage into the adrenals, frequent hemorrhage into the skin, muscles, brain and other organs, focal necrosis of the liver, myocarditis and acute splenic tumor. He states that the infection causing this syndrome is often so overwhelming in nature that early recognition is important so that treatment may be prompt. In the majority of reported cases death has occurred within twenty-four hours after the onset.

Herrick⁴ says that most of the meningococcal infections are bacteremic before they attack the leptomeninges. In speaking of this syndrome associated with meningococcal infection he says "No other infection so quickly slays."

Martland,⁵ in reviewing 19 autopsy cases, states that the medical history and clinical data obtained were not sufficiently comprehensive because death occurred so soon after the onset of the illness.

The most common symptoms they record are headache, vomiting, gastrointestinal symptoms, fever, chills, abdominal pain, general pain over the entire body, cyanosis and ecchymotic and purpuric spots varying in size from small petechiae to large areas, often confluent and forming a maculopurpuric rash over the body. The skin lesions may develop over the body even while the patient is being examined. The patient becomes rapidly worse in a few hours and soon becomes mentally confused, delirious and moribund. Frequently the pulse is imperceptible but may reach 200. The blood pressure may drop to 60 or 50 in a short time. The leukocyte count recorded in 5 cases ranged from 20,200 to 99,500. Positive blood culture was present in only a few cases. In these 19 cases of Martland's, meningococci were obtained from the petechiae in 2 cases. In 5 of these 19 cases intravenous injections of sodium sulfadiazine and dextrose were given with no apparent change in the course of the disease. Intravenous saline solution and adrenal

cortex extract were tried in 5 cases with no apparent result. There was massive hemorrhage of the adrenals in all the typical cases. They stated that bullous lesions with necrosis of the skin were reported and gangrene of the toes or the whole extremity may occur rarely. Bernstein⁶ cited only 1 case in the literature in which gangrene of the toe or causalgia accompanied meningococcal meningitis.

In the report made by Martland in February 1944 he states that the Waterhouse-Friderichsen syndrome is apparently that of a fatal infection with a duration of from eight to forty-eight hours from the time of onset, that it is doubtful whether any patient recovers and that death is due to an overwhelming meningococcal infection rather than to insufficiency of the adrenal cortex.

Herrick believes that the meningococcal infection has a selective affinity for the delicate capillary endothelium of the adrenal. Cosgriff as late as August 1944 suggested that penicillin might prove valuable for the treatment of this condition.

REPORT OF CASE

A white woman aged 27, a schoolteacher, awakened on Aug. 22, 1944 with a slight sore throat. At dinnertime she had a slight headache and went to bed early. At midnight she began to vomit and complained of pain over the body, especially in the abdomen. When I saw her, about 4 a. m., the patient was still vomiting a little; she had pain in the abdomen but there was no definite localization of pain or rigidity. The tenderness was about the same over the left kidney area as over any other part of the abdomen. There were no marks on the body anywhere at this time, which was about 4:30 in the morning, or about four and one-half hours after the onset of the illness. She complained of pain on motion or pressure over the extremities and abdomen. She appeared dazed or mentally confused, answering questions slowly and hesitatingly, and no definite source of the manifest toxicity could be determined.

The possibility of a ruptured appendix was considered, although the period of time from onset of the illness seemed too short for this condition. That she might be taken into a hospital quickly, a ruptured appendix was given as a provisional diagnosis. At about 4:30 a. m. arrangements were made for her to go to the hospital as soon as possible. She arrived in the hospital at 7:30 a. m. The sister in charge telephoned when the patient reached the hospital to say that there was an extensive eruption over the body. Later the sister said that, from the time she went to make the call until she returned to the patient, the purpuric spots had increased noticeably. The patient's mother then volunteered the information that these purpuric spots began to appear about 5 a. m., starting on the right thigh and extending distally with great rapidity. She stated that these spots "popped out just like corn popping." At 9 a. m. the purpuric blemishes of varying size were very extensive over the body; only a few small petechiae appeared on the face. On the upper areas of the body and the upper extremities, the eruptions were larger than those on the face. On the knees, legs and feet there were many large areas with what appeared to be thrombotic centers. Both the great toes and several of the small toes seemed almost gangrenous at this time. At the dorsal area of each foot a purplish discoloration extended proximally from the base of the toes.

The patient had a slightly loose stool. This indicated the possibility of an intestinal infection. Sulfaguanidine was started at once. Because of the rapid progress of the disease, penicillin was administered, 20,000 units of the substance injected intramuscularly at about 9 a. m. and ordered to be given every four hours, although no laboratory report had yet been received. The pulse and temperature were about normal when the patient was seen at her home. Soon after arriving in the hospital the temperature rose to 102 F. and the pulse rate to 136. Approximately three hours after the second dose of penicillin had been administered the temperature dropped to 99 F., the pulse rate

to 80. In the meantime the laboratory report arrived and showed a leukocyte count of 9,600; the urine and blood were within the limits of normal.

About midnight the nurse reported that the pulse was weak and irregular and that the patient was restless, was confused and complained of pain in the extremities. Her feet and legs were cold and clammy.

The following day an attempt was made to administer intravenous glucose. The vein was easy to enter, but no solution would flow in, although the blood came out quite readily. The blood pressure had now dropped to 60 and at times was almost unobtainable. After several attempts were made to give intravenous glucose without satisfactory results, an ampule of ephedrine was given. About fifteen minutes later the fluid flowed in freely. From this time on not much difficulty was encountered in giving intravenous solutions. At this time adrenal cortex extract was given. Another report from the laboratory showed that the leukocyte count had risen to 47,000 (this was on the second day).

On the third day the patient began to bleed from the nose and the vagina. This was about two weeks from her normal menstrual period. The bleeding was not excessive, but 3 cc. of a hemostatic was given in the hope that it might serve to check hemorrhage from the adrenals. The external bleeding stopped promptly. The patient showed some improvement from the third day on, and on the fifth day there was a decided improvement in her general condition. Several toes were now definitely gangrenous, and many large ulcerated areas were present on the knees, legs and feet. In the centers of these large, ulcerated areas were gangrenous regions, some of them 2 or 3 cm. in diameter. The only one located above the knees was on the right buttock. The temperature rose to 103 F. at this time. This was probably due to the infection in these gangrenous areas.

Large wet antiseptic packs were ordered, to cover all the gangrenous parts on the knees, legs and feet.⁷ The temperature then came down quite promptly. These packs were put on for forty-eight hours and then removed, to be replaced as soon as the temperature began to rise again. The patient was now eating well and on the tenth day sat up in a chair. Except for the pain in her feet, she complained very little. The purpuric spots on the arms, hands and upper part of the body faded gradually, leaving small, purplish spots. Over a period of several days the necrotic areas were cut away from the centers of many of the large ulcers. The antiseptic packs were kept on at intervals to prevent extension of the infection and gangrene. With the aid of these packs we could safely wait for a definite line of demarcation so that nothing but the necrotic tissue need be cut away. Penicillin and sulfaguanidine were discontinued on the eighth day after the patient had entered the hospital. One month later she was taken to the operating room and given spinal anesthesia, and the following toes and fragments of toes were removed: the great toe on the right foot, including the distal end of the metatarsal bone; the distal phalanges of the fourth and fifth toes of the right foot; the great toe of the left foot except the proximal phalanx, and all of the third and fourth toes of the left foot. The wounds were all closed fairly tight and healed with but little further removal of tissue. Two weeks later the patient walked with a pair of improvised shoes. At the end of four weeks following the operation she drove her car to the office. The general condition of the patient is good and she walks with very little impairment in her gait.

CONCLUSION

It is impossible to state definitely that any case presents all of the symptom complex of the Waterhouse-Friderichsen syndrome of meningococcic type unless an autopsy is made. The external signs and symptoms seem to place this case in this class. The administration of penicillin perhaps accounts for the favorable result.

FATAL AGRANULOCYTOSIS RESULTING FROM THIOURACIL

M. IRENE FERRER, M.D.; DAVID M. SPAIN, M.D., AND
RICHARD T. CATHCART, M.D., NEW YORK

The use of thiouracil in the treatment of hyperthyroidism has become widespread. It therefore seems timely to point out that the drug is not completely free from harmful effects. Notable among the complications occurring during the course of thiouracil therapy is agranulocytosis. This may have its onset without any warning and end fatally. Himsworth¹ reported 1 fatal case of agranulocytosis occurring during thiouracil treatment. Details, however, are lacking in this case as to the total dosage and duration of treatment. Astwood² reported another fatal case of agranulocytosis. His patient was a man aged 37 with a classic picture of hyperthyroidism. He had received 0.2 Gm. of thiouracil five times a day for twenty-seven days and then 0.4 Gm. five times a day for six days. On the thirty-fifth day he was discharged from the hospital only to be readmitted two days later with severe pharyngitis and a temperature of 103 F. The white blood cell count was 1,100, and no granulocytes were present. Despite intensive treatment with sulfathiazole, liver extract and pentnucleotide the patient died seven days later. Kahn and Stock³ more recently reported still another case of agranulocytic death of a diabetic patient following the use of thiouracil. Their patient received a total dosage of 30.8 Gm. over a fifty-four day period. At this point the white blood cell count dropped to 1,100, with the appearance of a rash and a pharyngitis. Again despite intensive treatment with transfusions, liver extract and penicillin the patient died in a diabetic coma within five days after the onset of the symptoms. Palmer⁴ in a study of 12 thiouracil treated cases observed the depression in the white blood cell count in 2 cases without a change in the differential count. In these 2 cases the white blood cell count returned to normal within three days after discontinuance of the drug. Williams,⁵ in a recent review of 125 cases, observed agranulocytosis in 2 cases; no details are given. In a previous report Williams and Clute⁶ observed 1 case of agranulocytosis in which recovery followed treatment with large doses of pentnucleotides and liver extract. Bartells,⁷ however, in a series of 11 cases noted no untoward effects during the course of the treatment.

Our purpose in this paper is to report an additional case of agranulocytosis following the use of thiouracil, with necropsy.

REPORT OF CASE

History.—A man aged 70, Czechoslovakian, an artist, had fifteen hospital admissions over the past twelve years. Most of these admissions are irrelevant to the present story. Several years before the present admission he had been noted to have an elevated basal metabolic rate and an x-ray shadow in the superior mediastinum interpreted as a substernal thyroid. Because of the age of the patient and the technical difficulties involved, surgical removal of the thyroid was not considered feasible. He was admitted for the fourteenth time Jan. 16, 1944. The chief complaint was weakness and extreme fatigue. The history revealed that he had lost a considerable amount of weight in spite of a good appetite. In addition, he had been suffering from persistent diarrhea and for a few days prior to admission had a productive cough and moderate chest pain.

At that time the patient was extremely emaciated and chronically ill. He was slightly orthopneic and perspired freely. There was a fine tremor of the hands. The thyroid was not palpable. The heart was enlarged to the left, with a systolic

murmur at the apex. Auricular fibrillation without pulse deficit was present. Scattered rhonchi were heard throughout the lungs. The remainder of the physical examination was entirely negative. The diagnosis of hyperthyroidism was made.

The patient weighed 97 pounds (44 Kg.) on admission. He was given a fifteen day trial of iodine without response. Diarrhea and weakness continued. Administration of thiouracil was then begun. The patient received 0.2 Gm. of the drug four times a day for the first three days. The dose was then increased to 0.3 Gm. four times a day. The latter dosage was maintained throughout the patient's hospital stay. During the first five days of treatment the white blood cell count fell from 9,500 with 60 per cent polymorphonuclear leukocytes to 5,150 with 65 per cent polymorphonuclear leukocytes. During the next thirteen week period the patient gained 31 pounds (14 Kg.). All gastrointestinal symptoms had disappeared. His basal metabolic rate dropped from plus 40 to plus 2. The pulse rate dropped from an average of 100 to an average of 80. The tremor disappeared. His weight of 97 pounds on admission rose to 124 pounds (56 Kg.). The white blood cell count during this period ranged from 5,100 to 7,400. He was then placed on a maintenance dose of 0.9 Gm. daily of thiouracil and discharged to the outpatient department on the one hundred and thirty-first hospital day.

He was followed in the clinic from May 29 until July 3, 1944. During this time he remained asymptomatic and maintained his weight at 124 pounds. In general his health had been excellent and he was completely free from infection. He was kept on 0.9 Gm. of thiouracil once a day for twenty-nine days. Then the dosage was cut to 0.6 Gm. daily for seven days. On July 3 a white blood cell count was taken and was found to be 1,250, with 37 per cent polymorphonuclear leukocytes. He was immediately admitted to the hospital.

The patient felt well for the first two days. His temperature then began to rise and on the fourth day was elevated to 105 F. On the fifth day he was noted to have an inflamed pharynx. The temperature continued to be elevated and his pharyngitis progressed in severity. He died on the seventh hospital day. During this period the white blood cell count continued to fall and was 450 without any granulocytic cells on the day of death. Pentnucleotide given intramuscularly and blood transfusions were of no avail. He had received 113.6 Gm. in one hundred and twenty-eight days.

It should be noted that following the transfusion his temperature became elevated. Penicillin was administered during the last twenty-four hours without any effect on the temperature or course.

Postmortem Examination (performed forty-eight hours after death).—The pharynx was intensely congested and reddened. The thyroid had a normally situated left lobe which was slightly smaller than normal. The isthmus was unchanged. The right lobe was found to be entirely within the apex of the right chest and compressed the apex of the lung downward. It was five times the usual size and coarsely nodular, with the nodules ranging in size from 2 to 4 cm. in diameter. Some of these nodules contained calcium and bone formation, while others were hemorrhagic and necrotic. Large follicles of colloid were visible on section. The trachea was not compressed. The left lobe had a smooth surface. On section it presented a fine, honey-combed appearance. The heart weighed 400 Gm., and all its chambers were dilated. The valves were unchanged, and the ventricular walls were not hypertrophied. The coronary arteries contained a few atheromatous plaques. The lungs showed patchy areas of hemorrhagic consolidation, particularly in the lower lobes. The bone marrow (vertebral and ribs) appeared unchanged. There were no other gross abnormalities.

Microscopic Examination.—The right lobe of the thyroid contained numerous adenomas. For the most part the follicles were filled with colloid; however, the lining of these follicles consisted of low cuboidal cells. An occasional focus was devoid of colloid, and the lining cells appeared to be somewhat more hyperplastic. There was considerable fibrosis present. The left lobe showed nothing unusual. The bone marrow, both with hematoxylin and giemsa preparations, showed moderate hypoplasia of the granulocytic cells. There was definite decrease in the percentage of mature polymorphonuclear leukocytes. The kidneys contained hemoglobin casts in the collecting tubules. In the

lungs were patchy areas in which the alveoli were filled with red blood cells and an occasional lymphocyte. In the center of a few of these areas necrosis was present along with numerous bacterial colonies. The anatomic diagnosis was adenomas of the thyroid, agranulocytosis, hemoglobin nephrosis, dilatation of the heart and hemorrhagic lobular pneumonia.

COMMENT

The dosage given in this case is somewhat higher than that which is generally used at present. It was problematic, however, whether the total dosage was related to the onset of the agranulocytosis. It is thought that this complication occurs on the basis of developing sensitivity or idiosyncrasy rather than on the cumulative effect of the drug. In relation to this, Williams,⁸ in an analysis of 2 cases treated with thiouracil, in 1 of which death occurred of cerebral hemorrhage and in the other of bronchopneumonia, found that the highest concentration of the drug was in the adrenals, pituitary and bone marrow.

Another finding of interest in this case was the hemoglobin casts in the renal tubules. The patient, however, had several transfusions with rather characteristic transfusion reactions, so that this anatomic change may be accounted for entirely on this basis. However, renal complications with the use of thiouracil have been reported. Palmer⁴ reported hematuria without the presence of casts in 1 case, while Williams⁶ reported 6 cases in which edema and albuminuria developed. These signs cleared after cessation of therapy. Since this drug is closely related to the sulfonamides and since it is soluble at a *pH* of 8.5, it has been suggested that if the renal complications tend to become severe or increase it might be advisable to administer sodium bicarbonate along with the thiouracil. Other toxic manifestations, such as skin eruptions or jaundice, were not noted in this case.

BILATERAL TEMPORAL ARTERITIS WITH COMPLETE LOSS OF VISION

EDWARD W. SHANNON, M.D., CLEVELAND, AND
JAMES SOLOMON, M.D., BOSTON

Since the original paper of Horton, Magath and Brown¹ many cases of temporal arteritis have been reported, and this syndrome is now recognized as a definite clinical entity.

Temporal arteritis is a self-limited, nonfatal disease characterized by headaches more or less constant and frequently worse at night, general malaise, lassitude, weakness, night sweats and low grade fever, and frequently there is pain in the jaws which makes chewing difficult. The temperature ranges from 98 to 103 F., and the blood may show a mild leukocytosis and an anemia. Mental symptoms are not common, but in a case reported by Sprague² there was definite dulling of the intellect. Most of these patients have rather severe constitutional symptoms and appear much sicker than the objective signs would indicate. In the typical case, a few weeks after the onset of the headache, the temporal arteries become tortuous, enlarged and very prominent. Frequently nodules appear along the arteries, which are tender. As the periarteritis progresses, the arteries become thrombosed and all pulsation stops. The occipital arteries are sometimes involved.³ The fact that the muscle and joint symptoms as well as the constitutional symptoms are so extensive suggests that arteries other than those of the head are involved.⁴

All of the case reports thus far published have been of persons over 50 years of age. There is no significant predilection for either sex.

COORDINATED RESEARCH FOR THE TESTING OF ANTIMALARIAL DRUGS

To the list of volunteers who have aided the advancement of medical science may now be added prisoners in three American penitentiaries. Civilian investigators, aided by grants of funds from the Committee on Medical Research of the Office of Scientific Research and Development, and members of the Army, Navy and Public Health Service have participated in the program. Since March 1944 over 100 prisoner volunteers in a United States penitentiary have been exposed to relapsing vivax malaria in final tests of potential antimalarial drugs prior to their use in the armed forces. Over 100 more volunteers in two other prisons have taken large doses of new drugs for long periods of time to determine whether or not the drugs may safely be used in the prevention and treatment of malaria. The three institutions in which the cooperation of the prisoners has made possible the continuing success of this most important link in the chain of studies to discover a medicinal agent more effective than any now in use against malaria are the United States Penitentiary at Atlanta, Ga., the Illinois State Penitentiary, Stateville, Joliet, and the New Jersey Reformatory, Rahway. In all three penitentiaries the officials and the custodial staffs have cooperated fully.

Quinine and atabrine are efficacious in suppressing the clinical attacks of vivax (benign tertian) malaria, but neither is capable of eradicating the disease completely. Early in 1941 an integrated and comprehensive program of research was organized by the National Research Council and supported by the federal government through the Committee on Medical Research of the Office of Scientific Research and Development. Later the entire program was integrated under the Board for the Coordination of Malarial Studies, a joint body composed of representatives from the Army, Navy, Public Health Service, Office of Scientific Research and

Development and the National Research Council. Acting under the board are four subcommittees—the Panel on Synthesis, the Panel on Biochemistry, the Panel on Pharmacology and the Panel on Clinical Testing—which direct the research on malaria and on the development of new antimalarials. The Panel on Biochemistry comprises a group of investigators who are studying the fundamental relationships between the parasite and the cells of the host which it infects. It is concerned also with the mechanism of action of antimalarials on the various developmental stages of the parasite. The Panel on Synthesis supervises the work of chemist-contractors and cooperating pharmaceutical companies engaged in the synthesis of chemicals which are to be tested for antimalarial action. When a drug appears promising, the entire group to which it belongs is fully studied, all chemically related compounds being tested in several avian species. The Panel on Pharmacology supervises the testing of drugs for antimalarial action in animals. These drugs are first tested on chickens, ducks, canaries and turkeys artificially inoculated with their respective species of malaria parasites. Drugs which show promise in these lower animals are then tested, when practicable, on monkeys artificially infected with the species to which these animals are susceptible. Although drugs found to exert antimalarial activity in animals do not necessarily show the same degree of activity in human beings, the vastness of the program necessitates this type of screening in lower animals. This panel also directs studies of acute and chronic toxicity in animals. The Panel on Clinical Testing receives the drugs which have shown promise against malaria in lower animals and monkeys and determines their effect in man.

Chemists have been brought together to synthesize the potential antimalarials; parasitologists to test these compounds against the malarias of birds and monkeys, pharmacologists to determine the relative safety of the effective drugs in higher animals and man, biochemists to develop methods for measuring the amounts of a drug dissolved in the blood and deposited in the tissues of the body and to study the chemical relationship between parasite and host, and finally physicians to put the drugs to critical tests against malaria in man.

The first trial of a promising drug in man is usually carried out against malaria used for the treatment of syphilis of the central nervous system. The malaria is given to the syphilitic by the transfusion of blood containing the parasites, not by mosquito bites, and is treated with the new drug at small, relatively safe doses. Malaria induced by blood transfusion does not relapse; therefore, if a new drug is successful in these preliminary trials, it must be tested against malaria induced by mosquito bite. In order to accomplish this under controlled conditions which will establish beyond question the

effectiveness of the new compound, the drug is tried on normal men willing to contract malaria through the bites of infected mosquitoes and willing to endure the risks associated with taking large amounts of relatively unknown and possibly dangerous drugs.

The three penitentiaries have supplied the testing ground and the human volunteers for such definitive clinical tests of the safety of new drugs and of their effectiveness against malaria acquired by mosquito bite. The immediate direction and supervision of this testing program has been the task of a field laboratory of the National Institute of Health of the U. S. Public Health Service at Atlanta, of the Department of Medicine of the University of Chicago at Stateville, and of the Departments of Medicine and Pharmacology of New York University Medical School at Rahway. All three projects are being carried out under contracts with the Office of Scientific Research and Development.

A prison is an ideal proving ground. Here, in one circumscribed area, live hundreds of men, eating the same meals, working under the same schedules and living the same regimented unvarying existence. To these controlled conditions the medical scientist adds the further safeguards needed to assure the drug a fair and impartial evaluation in its crucial laboratory test. At Atlanta, out of 325 volunteers over 100 have already been infected with malaria and have taken the new drugs that may mean the end of a long and arduous search; at Stateville some 400 prisoners answered the call for volunteers, of whom more than 50 have already started on courses of high doses of new drugs to determine whether or not they may be given safely over long periods; within a month another group of volunteers will receive malaria by the bite of infected mosquitoes and will also receive a new drug in maximum tolerated doses. At Rahway 60 volunteers are deliberately taking increasingly larger doses of several different compounds until the ceiling of safe administration can be established.

When the experiments were begun, the men were fully informed of the objectives of the work, the nature of the disease, the hazards and the inconveniences. A man who volunteered for the experiment was warned to expect malaria—since he surely would develop it were the drug under test not completely preventive in the dosage used. And he was flatly warned that malaria meant that he could anticipate one long siege of trouble for a year and a half or perhaps longer.

By lot, fifteen men draw for positions in the test. Ten of these will begin the drug four days before infection, five will receive enough to test for a possible effect against the earliest hidden forms of the malaria parasites and five will undergo a longer course of treatment to test for a suppressive effect against the clinical attack of malaria which may be expected to appear from six to twenty days after the mosquito bites. The

remaining 5 will not receive the drug; these are the controls and must develop malaria to prove that the mosquitoes actually were carriers of infection to the other 10. When clinical malaria has appeared, these controls are used in tests of the curative value of the drug.

The only sure test of infection is finding parasites in the blood; for this the volunteers give a drop of blood from the finger almost daily for months. Serologic tests for the diagnosis of latent malaria are under investigation and chemical tests must be run on blood samples from each man to determine the amount of the test drug circulating in his blood. For these purposes the volunteers submit to the withdrawal of as much as 50 cc. of blood daily for over a week and then at periodic intervals for a month or more. Two weeks after the infecting bites the controls are sick; perhaps a few of the men taking the drug for the short term have also been stricken with malaria. When the men are ill they are given the best possible care in a special unit of the well equipped prison hospital. When the men develop malaria they are treated promptly with large doses of one of the test drugs, and as soon as they are well they return to their jobs in the prison. Periodic observations are continued for months in order to record every instance in which the disease relapses.

Another type of experiment conducted in two of these prisons involves the study of the acute and chronic toxicity of new drugs. Groups of 15 to 30 men each are given daily doses and weekly doses for periods extending over weeks or months. During this time their symptoms are recorded, charted and plotted. They are examined frequently for any gross evidence of toxicity, and the quantity of drug in the plasma is determined frequently. Other tests to evaluate injury to the kidneys, blood, bone marrow and other tissues are instituted.

These experiments have four major functions: (1) to demonstrate the tolerance to the drug of men living under ordinary conditions of activity, (2) to determine whether any latent chronic toxic manifestations result from the prolonged administration of the drug, (3) to determine whether, when given daily or weekly, the drug tends to accumulate in the system or whether excretion keeps pace with administration, and (4) to determine the most satisfactory dosage schedule which will afford a plasma level adequate to protect against vivax malaria.

This research is a demonstration of the manner in which certain projects in the field of medical research are best conducted under governmental auspices. Already medical science has gained vastly; the reports that come from the Bush committee should do much to stimulate a permanent useful mechanism for this type of coordinated research.

PENICILLIN TREATMENT OF VIRUS DISEASES

Experimental confirmation of clinical experience¹ that penicillin is ineffective against virus diseases is reported by Parker and Diefendorf² of the Western Reserve University School of Medicine. Equine encephalomyelitis, meningopneumonitis, psittacosis, St. Louis encephalitis and two strains of vaccinia virus were tested by these investigators. Two methods were used to determine virucidal effects. By the first method the virus was cultivated in Rivers-Li culture medium³ consisting of a suspension of chick embryonic cells in Tyrode solution, with or without penicillin. After five days' incubation the penicillin containing cultures and the non-penicillin controls were titrated for virus. By the second method, both virus and penicillin were injected into the yolk sac of intact chick embryos or placed on the chorioallantoic membranes. Development of lesions on the membrane or death of the embryo was taken as a criterion of virus growth.

The results of experiments in which viruses were cultivated in Rivers-Li medium showed that the rates of growth in the presence of 10 Oxford units of penicillin per cubic centimeter within the limits of the experimental error are identical with the rates in the nonpenicillin controls. Similar negative results were obtained in many of the intact chick embryos. In one series of experiments 14 day embryos were inoculated on the chorioallantois with a quantity of vaccinia virus sufficient to give 15 to 50 lesions on each membrane. In the therapeutic tests 500 Oxford units of penicillin was injected into each egg either twenty-four hours before the inoculation or at the time of the inoculation. Differences could not be distinguished between the control and the treated embryos either in the size or number of lesions when the membranes were examined two days later. Negative results were obtained also with St. Louis encephalitis and with equine encephalomyelitis virus.

Distinct therapeutic effects were obtained with meningopneumonitis virus and slight therapeutic results with psittacosis. Of 20 control embryos injected into the yolk sac with meningopneumonitis virus 19 died by the end of the tenth day. In 30 similarly injected embryos treated with 400 Oxford units of penicillin only 6 died by the fourteenth day. Fifty Oxford units gave negative results. With psittacosis virus the 90 per cent control mortality was reduced to 80 per cent by one or more yolk sac injections of 500 to 600 Oxford units.

These positive results are of little clinical interest, since maintenance of a comparable blood concentration

of penicillin in man would require the daily injection of several million Oxford units of penicillin. On the whole, Parker's experiments confirm the current clinical belief that penicillin is without practical therapeutic value in virus infections.

THE HILL-BURTON HOSPITAL CONSTRUCTION BILL

Elsewhere in this issue appear the statements made by two representatives of the American Medical Association before a hearing of the Senate Committee on Education and Labor on the so-called Hill-Burton Hospital Construction Bill. The Board of Trustees of the American Medical Association at a recent meeting indicated that the general policies of this measure are within the platform of the American Medical Association and expressed the opinion that the bill should receive the support of the medical profession.

As was pointed out by Dr. R. L. Sensenich, this measure embraces the principle that the need for an institution is to be established by adequate evidence before funds are allotted for its construction. The Hill-Burton measure recognizes that conditions vary as regards health in different parts of the United States. Obviously the success of this measure, if it becomes effective, will depend largely on the constitution of the Federal Advisory Council, which will have more authority than has generally been granted to such advisory groups in relation to federal agencies. Several suggestions were made by Dr. Sensenich tending toward strengthening of the responsibilities of this council.

As Dr. Sensenich pointed out also the term "public health center" has never been clearly defined. Such an agency might under present definitions undertake a number of functions quite outside the scope of either preventive medicine or the extension of medical service where needed. In certain areas of this country a public health center might be required to undertake procedures which would not be considered either desirable or necessary in other areas.

In his testimony on the Hill-Burton measure Dr. Victor Johnson supplemented the statement of Dr. Sensenich. He emphasized the desirability that a Federal Advisory Council, dealing with the construction of hospitals and health centers, include men of experience in the fields concerned; because of such experience they could command the full support of hospital administrators, physicians and the public.

Dr. Johnson took advantage of the occasion to emphasize again the great importance of legislation which would guarantee for the postwar period adequate numbers of premedical and medical students,

A medical service is no better than the quality of the physicians who render the service. The mere construction of facilities is not in itself any guaranty to an area that it will have sufficient medical care of high

quality. Complete effectiveness in achieving the objective that the proponents of the Hill-Burton measure desire to achieve can come only when construction of facilities is dependent on evidence of ability to maintain the institution and to provide competent personnel.

Current Comment

PENICILLIN AVAILABLE THROUGH NORMAL COMMERCIAL CHANNELS

Effective March 15, producers and distributors of penicillin may sell this drug through normal commercial channels. The material will be released in vials containing 100,000 units of sodium penicillin for human parenteral medication. Since May 1944 a limited amount of penicillin has been available for civilian use through the Penicillin Distribution unit in Chicago, which was established by the War Production Board. Hospitals will not be required to place orders through the Penicillin Distribution office, as has been done since last May. However, the office will remain open for a while to meet emergency needs. If a hospital is unable to get penicillin from a distributor it may order from the WPB Chicago Penicillin Distribution office. Distributors have been authorized to sell 1,280,000 packages from March 15 to March 31. An additional quantity of approximately 1,500,000 vials will be made available for distribution in April. Similar quantities are expected to be released each month. Penicillin is not yet in sufficient supply to permit its use in manufactured pharmaceutical products such as pills, lozenges, ointments and other miscellaneous dosage forms. The development and control of penicillin present one of the most important contributions to modern therapy. Cooperation throughout the entire project has been excellent, and all participating members have reason to be proud of their record.

EXPERIMENTAL TRANSMISSION OF RHEUMATIC FEVER

The difficulty in experimental transmission of rheumatic fever has always proved a stumbling block to investigations on that disease. Several years ago Birkhaug¹ reported the self inoculation of a filtrate obtained from a strain of nonhemolytic streptococci isolated repeatedly from a patient with rheumatic fever. About twenty-four hours after the injection acute multiple arthritis developed with fever, pain, swelling and redness. This condition subsided in a few days. Birkhaug's description of the course of events was so striking as to make repetition of the experiment on a larger scale highly desirable. Now Copeman² reports the results of some experiments on the transmission of rheumatic fever to a group of adult volunteers. This

experiment, like that of Birkhaug, was on a highly restricted basis. It consisted in injecting the blood of a patient suffering with typical rheumatic fever into 5 volunteers. The blood of those who showed any reaction to the initial injection was then taken and injected into a further group of volunteers. Only in the fourth transfer or "generation" of volunteers was there failure to observe reaction of any sort. Of the first group of 5 volunteers receiving blood from a patient with typical rheumatic fever 2 developed mild attacks of rheumatic fever after twenty-four hours. Pain in the shoulder muscles without fever developed three days later in a third volunteer. The blood from the first two volunteers who developed symptoms was pooled on the third day and passed on, producing what appeared to be an attack of fibrositis with fever on the second day in 1 of 4 recipients. The blood of the more severely affected of the first two was again transferred on the seventh day of illness to 4 other volunteers. One of these developed generalized pain (which Copeman calls fibrositis), which six weeks later showed signs of becoming chronic. Finally, the blood of this patient was transferred to 4 recipients on the seventh day after he had himself received a blood inoculation. One of the latter developed mild fever and transitory generalized pain followed in five weeks by a faint apical systolic murmur. Blood taken from this patient on the fifth day, however, did not produce any effect on 4 recipients. Although this group is small and inadequately controlled, as Copeman points out, the results are sufficiently suggestive to warrant extensive and controlled repetition and further investigation. For this purpose monkeys and more particularly human volunteers, who may be available in larger number now than ever before, could well be employed.

ANTEPARTUM PENICILLIN THERAPY

Transmission of penicillin from mother to unborn child through the placental barrier is reported by Greene and Hobby¹ of King's County Hospital, Brooklyn. Four normal patients were tested while in active labor, delivery being expected within two hours. From 20,000 to 100,000 Oxford units of penicillin was injected intravenously into each patient. Samples of maternal blood were taken at the time of delivery, with a sample of placental cord blood as soon as the baby was separated from the placenta. The serum from each blood sample was titrated for penicillin, hemolytic streptococci being used as the test organism. At the time of delivery (thirty minutes to two hours after injection) the amount of penicillin in the maternal blood varied from 0.01 to 0.19 Oxford unit per cubic centimeter, with an average of 0.084 Oxford unit. The average titer of the cord blood was 0.034 Oxford unit, or 40 per cent. of that in the maternal circulation. Apparently, then, penicillin passes through the human placenta in sufficient amounts to raise the penicillin titer of the fetal blood stream well above the bacteriostatic level. Practical applications of the implied antepartum penicillin therapy have not yet been suggested.

MEDICINE AND THE WAR

ARMY

ANNOUNCEMENT OF QUALIFYING TEST FOR ASTRP

The Sixth Service Command, Chicago, recently announced a nationwide qualifying test for the selection of candidates for the Army Specialized Training Reserve Program which will be conducted on April 12 at all high schools and colleges to which eligible applicants submit requests for the examination. The examination will be administered by a civilian agency which will be responsible for distribution of tests, scoring and reporting results. Complete information will be furnished school officials about March 1. The test will be open to young men who were born after Sept. 30, 1927 and before Sept. 1, 1928 and who will have graduated from high school prior to date of their enrolment in the ASTR Program. Those who qualify on this test will be eligible for enrolment in the ASTR and assignment to selected colleges and universities for terms beginning in the months of July, August and September 1945 only.

To establish eligibility for enrolment in the ASTRP, those who pass the qualifying test are required to enlist in the Enlisted Reserve Corps, but they are not called to active duty until fourteen days after the completion of the term in which they become 18 years of age. Depending on their age at date of entrance into the program, they are eligible for two, three or four twelve-week terms. Trainees accepted for the ASTRP are furnished transportation from their homes to the designated educational institutions, housing, messing, tuition, books, medical care and complete uniforms while in attendance at college. The program may be considered as the equivalent of a government scholarship which effects a saving to parents of about \$1,000 in costs of education for the average young man who is eligible for college training for three twelve-week terms.

The course of study in the ASTRP includes mathematics, physics, chemistry, English and history. Those who have completed one or more terms of college will be placed in terms of the course at appropriate levels. A progressive course of physical education is conducted under qualified instructors for six hours a week and the trainees receive five hours a week of basic military training, which is a decided advantage to them when they subsequently are called to active duty and sent to, army camps for basic training.

It is desired that the widest publicity be given this program to insure that all school officials, eligible young men and their parents are fully informed of the educational opportunity available to those who can pass the qualifying test on April 12. Applications to take the test should be addressed to high school principals or college registrars and should be submitted as early as practicable. Applications must reach school officials not later than March 31.

REFRESHER COURSES FOR SOME MEDICAL OFFICERS

Major Gen. George F. Lull, Deputy Surgeon General, U. S. Army, recently announced that officers of the Army Medical Department who have been occupied with administrative and other nonprofessional work and who are being assigned duty utilizing their professional skills will have the opportunity of taking courses in their specialties under a new training program just inaugurated. The training will be voluntary and will be open to those members of the Medical Corps who, because of assignment to command, administrative or semiprofessional positions, have not been engaged in the professional side of medical service during the past twelve months or more and whose future military assignments will require professional activity. Every Medical Corps officer of the Army Service Forces returning from overseas assignment will be informed at redistribution stations of this new training program and will

be asked to state whether he desires to avail himself of the opportunity. These refresher courses will be given at general hospitals and certain regional hospitals selected by the Surgeon General. Requests for this training will be submitted through channels to the Surgeon General, who will make assignments to hospitals. Officers selected for these courses will go on temporary duty for a period of not more than twelve weeks.

SANITATION COURSE

Twenty-five Hospital Corps officers were selected and ordered to report to the medical officer in command, Medical Research Unit No. 1, Berkeley, Calif., January 1, for temporary duty under instruction in practical sanitation at the University of California for a period of three months. The first two months of the course will be devoted to intensive instruction in the various phases of sanitation. The last month will be utilized for practical field training in sanitation, and on successful completion of the course the officers will be ordered to various naval activities for duty as sanitary inspectors. A second class for this course of instruction will be convened at the University of California, April 1.

AUTHORIZED BADGE FOR MEDICAL PERSONNEL IN COMBAT

A special badge will be awarded to army medical personnel who serve with combat units under fire. The badge is of silver metal, elliptic, with the Medical Department's insignie, the caduceus, and the Geneva Cross superimposed on a litter surrounded by a wreath of oak leaves, and is to be worn on the left breast above decorations and service ribbons. The regimental commander is authorized to make the award for "satisfactory performance of duty under actual combat conditions."

STATEMENT CONCERNING DISCHARGES HELD ERRONEOUS

Secretary of War Henry L. Stimson recently made it known that the statement attributed to the head of the Veterans Administration that 250,000 soldiers a month will be discharged immediately after the war ends in Europe is both unauthorized and without foundation. The basic elements in the War Department demobilization plan were made public last September 6 and remain unchanged. When hostilities cease in Europe the War Department intends to marshal against the Japanese every soldier and every item of equipment that can be used effectively to speed our final victory.

PRISONER OF WAR

Major Ralph W. Hubbard, formerly of Oklahoma City, who was taken prisoner by the Japanese at the fall of Bataan about two and a half years ago, is believed to be in Cabanatuan, Philippines. Recently a message intercepted in a Japanese propaganda broadcast and forwarded by the United States provost marshal indicates that he has been receiving letters, packages and pictures from his wife and other relatives. Dr. Hubbard graduated from the University of Oklahoma School of Medicine, Oklahoma City, in 1932 and entered the service Sept. 27, 1940.

TREAT LUZON INTERNEES

Major Nelson Chestnut, formerly of Springfield, Ill., and now commander of the 607th medical clearing company, stated that there were 145 litter cases among the 2,121 liberated persons from the Los Banos internment camp.

ARMY MEDICAL OFFICERS RESCUED ON LUZON

Twenty-one officers of the Army Medical Department, including thirteen doctors, three medical administrative officers, four dentists and a veterinary officer, were named in the first list of prisoners freed from Camp Cabanatuan on Luzon. The list of those freed from Santo Tomas University, Manila, included sixty-six nurses, a physical therapist and a hospital dietitian. The full list of freed prisoners has not yet been officially released and may contain the names of other medical corps officers in addition to the following:

Col James W. Duckworth, Gosport, Ind.
Lieut. Col. John Edward Kallus, Caldwell, Texas
Major Ralph Waldo Hubbard, Oklahoma City
Major Emil Patrick Reed, Brownsville, Texas
Major Stephen C. Sitter, Milwaukee
Capt. Ralph Emerson Hibbs, Oskaloosa, Iowa
Capt. Charles Joseph Katz, Oak Park, Ill.
Capt. Charles Leasum, Sturgeon Bay, Wis.
Capt. Robert B. Lewis, Cape Elizabeth, Maine
Capt. Robert Kirkwood Whitley, Palo Alto, Calif.
1st Lieut. Harry Merrill Brown, Cicero, Ind.
1st Lieut. Charles Francis Lewis Jr., Oakland, Calif.
1st Lieut. Merle McNeill Musselman, Ann Arbor, Mich.

CHINESE FLIGHT SURGEON HERE

Col. Joseph Shiang-min Lee, flight surgeon, Chinese army, recently visited the Office of the Surgeon General to confer with officers of the training division. Colonel Lee, who is a member of the faculty of the Chinese Army Medical College, Anshun, China, received his military medical training in this country, graduating as a surgeon from the School of Aviation Medicine, Randolph Field, Texas, in 1933 and graduating from

the Medical Field Service School, Carlisle Barracks, Pennsylvania, in 1934. He is now visiting medical department training installations to observe the recent advances which have been made in the military and professional training program of the Medical Department.

ORGANIZING NURSE RECRUITMENT

Major Edith Aynes, chief of the Army Nurse Corps Branch of the Technical Information Division, Office of the Surgeon General, and Miss Evelyn Blewitt, civilian consultant to the Surgeon General on army nurse public relations, have returned to Washington after visiting Dallas, Texas, Los Angeles, San Francisco and Portland, Ore. There they conferred with advertising agencies, army nurse recruiting committees, army hospital superintendents and members of the Procurement and Assignment boards participating in the intensified drive for army nurses. A similar trip to the Middle West is planned for the near future.

ARMY MEDICAL DEPARTMENT PERSONNEL REPATRIATED

The War Department recently announced that seventy-seven officers and enlisted men of the Army Medical Department who have been released by Germany will arrive at Charleston, S. C., aboard a hospital ship some time in March. They are the first "protected personnel" under the Geneva convention to be repatriated in this war. The repatriates, whose kin have been notified of their expected arrival, were reported in good health when the hospital ship left Marseille, France. None will require hospital treatment, the War Department said.

MISCELLANEOUS

SURPLUS MEDICAL AND SURGICAL EQUIPMENT FOR CIVILIAN USE

The U. S. Treasury's Office of Surplus Property recently released surplus medical and surgical equipment and supplies by the armed forces for civilian use. Much of the material offered for sale was manufactured for use in the first world war and is in "new" condition, although shelf worn. Each month the regional offices of surplus property inform tax supported institutions and established firms on their mailing lists of medical and surgical properties available for purchase, through the national catalogue "Surplus Reporter." The catalogue, released on March 3, the fourth issue in the series, lists a wide variety of diagnostic and surgical instruments, laboratory equipment, drugs, supplies and treatment equipment of the type used in surgery, examination and treatment of eye, nose and throat, skin, brain and bone. Among the 500 items offered at this time are small 10 inch plaster of paris shears, hemostatic forceps, 6 inch uterine needles (one-half circle with cutting edge), over 5,000 bistouries, a large quantity of analytic filter paper (not acid washed), 250 mm. and of medium speed, over 4,000 rubber surgical operating cushions and a quantity of medical kits. B. Many of the instruments and supplies are displayed in the "sample rooms" maintained at the regional offices of surplus property, where representatives of the Treasury, selected for their professional knowledge, are on duty to assist potential purchasers. A list of the regional offices of surplus property follows:

Region I—Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont. Mr. J. D. Tompkins, regional director, Procurement Division, U. S. Treasury Department, Park Square Building, Boston 16.

Region II—Pennsylvania, New Jersey, New York. Mr. Frank L. Seymour, regional director, Procurement Division, U. S. Treasury Department, 50 Church Street, New York 7.

Region III—Washington, D. C., Delaware, Maryland, North Carolina, Virginia. Mr. M. P. Shlesinger, regional director, Procurement Division, U. S. Treasury Department, 499 Pennsylvania Avenue N.W., Washington 25, D. C.

Region IV—Indiana, Kentucky, Ohio, West Virginia. Mr. R. D. Schell, regional director, Procurement Division, U. S. Treasury Department, Commercial Arts Building, 704 Race Street, Cincinnati 2.

Region V—Illinois, Michigan, Minnesota, North Dakota, South Dakota, Wisconsin. Mr. F. A. Mapes, regional director, Procurement Division, U. S. Treasury Department, 209 South La Salle Street, Chicago 4.

Region VI—Alabama, Florida, Georgia, Mississippi, South Carolina, Tennessee. Mr. H. E. Harmon, regional director, Procurement Division, U. S. Treasury Department, Belle Isle Building, Atlanta 3, Ga.

Region VII—Arkansas, Louisiana, Oklahoma, Texas. Mr. Hamilton Morton, regional director, Procurement Division, U. S. Treasury Department, 609 Neil P. Anderson Building, Fort Worth 2, Texas.

Region VIII—Iowa, Kansas, Missouri, Nebraska. Mr. Thomas C. Stephens, regional director, Procurement Division, U. S. Treasury Department, 2605 Walnut Street, Kansas City 8, Mo.

Region IX—Colorado, New Mexico, Utah, Wyoming. Mr. Alden W. Pool, regional director, Procurement Division, U. S. Treasury Department, Seventh Floor, Exchange Building, 1030 Fifteenth Street, Denver 2.

Region X—Arizona, California, Nevada. Mr. John F. Hough, regional director, Procurement Division, U. S. Treasury Department, 30 Van Ness Avenue, San Francisco 2.

Region XI—Idaho, Oregon, Montana, Washington. Mr. Orrin C. Bradeen, regional director, Procurement Division, U. S. Treasury Department, 2005 Fifth Avenue, Seattle 1.

Region XII—Puerto Rico. Mr. J. T. Gilmer, regional director, Building F, Munoz Rivera Park, San Juan, Puerto Rico.

Honolulu, Hawaii. Mr. Hugh C. Tennant, Procurement Division representative, U. S. Treasury Department, Iolani Palace, Honolulu 2, Hawaii, T. H.

WARTIME GRADUATE MEDICAL MEETINGS

The following subjects and speakers for Wartime Graduate Medical Meetings have just been announced:

Michigan

Percy Jones and Convalescent Hospital, Battle Creek: Laboratory Technics in Differentiating Medical and Surgical Approaches in Regurgitational Jaundice, Dr. E. L. Tuohy, March 19; Anesthesia, Dr. J. S. Lundy, March 26.

West Virginia

The Recognition of Nutritional Deficiency Diseases, Dr. Richard W. Vilter, March 26.

ORGANIZATION SECTION

THE HILL-BURTON HOSPITAL CONSTRUCTION BILL

Summary of statements made February 28 to the Senate Committee on Education and Labor by Dr. R. L. Sensenich, member of the Board of Trustees of the American Medical Association, and Dr. Victor Johnson, Secretary of the Council on Medical Education and Hospitals of the American Medical Association, on Senate Bill 191 (abstracted in THE JOURNAL, January 27, p. 231).

Dr. Sensenich's Statement

On behalf of the American Medical Association, I wish to express my appreciation for this opportunity to appear before you to present the views of the Board of Trustees of the American Medical Association on Senate Bill S. 191. The facilities of the American Medical Association are at your disposal in the efforts to obtain a solution of the problem of providing adequate hospital facilities of a high quality for all the people of this country.

The Board of Trustees of the American Medical Association has given careful consideration to the provisions of the "Hospital Construction Act" in the light of the Platform of the Association. The Board, at a recent meeting, took action to the effect that so far as its general policies are concerned the Hill-Burton bill is within the platform of the American Medical Association; that while there are certain modifications that would better define some of its provisions and render the bill more effective, nevertheless it is the feeling of the Board that the bill in general should receive the support of the American Medical Association. . . .

If I may have your permission I should like to distribute a copy of the Platform of the American Medical Association to each member of the Committee and also to include a copy in the record of these hearings. The authors of the bill, and their advisers, are to be congratulated on the basic soundness of their approach.

The Platform of the American Medical Association with regard to the extension of medical care includes the recommendations that funds allotted by Congress "for the prevention of disease, the promotion of health and the care of the sick" should be based on "local determination of needs and local control of administration."

In this bill there has been full recognition of the fact that conditions relating to health and hospital problems vary tremendously in the different parts of the country. A hospital construction plan for a populous, highly urbanized Eastern state may be utterly unsuited to a sparsely populated state of the Rocky Mountain area. Neither of these may be adaptable to a prosperous corn-hog farm state or an economically ill favored tenant farmer state. The Hill-Burton bill appears to provide a maximum of flexible adaptation to local conditions, with a minimum of undesirable uniformity and regimentation.

Should this bill be enacted into law, its successful operation will depend in large measure on the constitution, competence, wisdom and prerogatives of the Federal Advisory Council. The extent to which there is general approval and support of the objectives of the bill will be determined by these appointments. It might be desirable to consider a rewording of the provisions for these appointments, so that lines 24 and 25 on page 14, and lines 1 and 2 on page 15 might read:

eight appointed members shall be persons who are representative outstanding authorities in fields pertaining to hospitals, public health and medical care activities, and a majority of them shall be representative authorities in matters relating to the operation of hospitals. The first term of four of the . . .

The role of the Federal Advisory Council and its relationship to the administrative activities of the Surgeon General of the Public Health Service are not entirely clear. The provisions of the bill seem sound in the case of the standards for state surveys of hospital facilities, calling for (page 3, lines 12, 13 and 14) "standards prescribed by the Surgeon General with the approval of the Federal Advisory Council" (*italics not in bill*) and in the provision (page 16, lines 19, 20, 21 and 22) requiring that "all regulations and amendments thereto with respect to grants to states . . . shall be promulgated *only when recommendation [italics not in bill] of the Federal Advisory Council. . . .*" Another desirable provision is that

(page 15, lines 20, 21 and 22) "upon request by three or more members [of the Federal Advisory Council] it shall be the duty of the Surgeon General to call a meeting of the Council."

On the other hand, there are certain provisions of the bill in which the prerogatives and responsibilities of the Federal Advisory Council are less clearly defined. For example, with regard to "Approval of Projects and Payments for Construction" (page 9) the Federal Advisory Council is not mentioned in the statement (lines 16, 17, 18 and 19) "The Surgeon General . . . shall determine whether or not to approve such a project." And again (page 11, lines 21, 22 and 23) it is stated that "the Surgeon General shall from time to time estimate the sum to which each state will be entitled under this section. . . ."

There are other instances elsewhere in the bill in which it is not clear whether the decisions of the Federal Advisory Council are mandatory or merely advisory and whether important decisions may be made by the Surgeon General himself. It would appear sound to vest a maximum of authority in a well selected Advisory Council which will collaborate with the Surgeon General, who in turn is the administrator of the Council's policies.

The definition of the "public health center" (page 13) might well be further clarified. Perhaps lines 6, 7 and 8 should be reworded as follows:

(d) The term "public health center" means a publicly owned facility for the provision of public health services as well as such medical care as state surveys indicate to be absent and needed, including related facilities . . .

Obviously, the exact nature of the "public health centers" cannot be sharply defined in advance, since these represent experimental projects. Presumably they will vary in constitution and function from state to state. Experimentation in the establishment of such units is highly desirable and they should be adjusted to local needs.

It is noted in the bill that while a State Advisory Council is provided under section 612 with reference to the preparation of a state plan, no State Advisory Council is provided in the selection of the specific construction to be undertaken under the state plan with the funds available. It would seem desirable to have the advice of some such body in the determination of what construction shall have priority or what modifications of the plan may be desirable as the construction program progresses.

Although maintenance or administration of hospital facilities by the government is not contemplated in the bill, attention has been called by those familiar with Public Law 137, 77th Congress, referring to schools and hospitals erected with government funds, to the content of section 203 (b) and (c) of that law.

Section 203 (c) reads as follows:

(c) No department or agency of the United States shall exercise any supervision or control over any hospital or other place for the care of the sick (which is not owned and operated by the United States) with respect to which any funds have been or may be expended under this title, nor shall any term or condition of any agreement under this title relating to, or any lease, grant, loan or contribution made under this title to, or on behalf of, any such hospital or place preclude or affect its administration, personnel or operation.

The authors of the present bill apparently are of the opinion that this point has been adequately covered in the organization provided.

In the consideration of the bill before the committee, the question of government contribution to maintenance was discussed where the location of a facility is determined on the basis of medical needs. In each community there will be those who are unable to pay for hospital care as well as those who are able to pay. The facility is established for all the people.

However, illness differs and provisions for treatment must meet the particular needs. Tuberculosis requires special hospitals, long hospitalization and some measure of isolation. Most tuberculosis hospitals are owned and supported by state or county units of government. County tuberculosis hospitals frequently are reimbursed from state funds at a fixed amount per patient daily.

The care of the insane has long been recognized as the direct responsibility of government.

Chronic illness of other types, especially the slowly progressing illness of the aged, requires long periods of hospitalization, and beds cannot be given over for these patients in hospitals planned for the care of acute illness. No doubt this fact will lead to the eventual establishment of more special hospitals for chronic disease. Some unit of government must support the indigent in these hospitals. State and local governments may be stimulated to accept their full responsibility.

A study of the indigent group reveals a great concentration of chronic incurable disease, the crippled and the mentally inadequate. The number of others who are temporarily medically indigent is relatively small.

The community may need a general hospital that will be practically self supporting if the individual indigent is given assistance by local responsible authorities.

No single plan for financial aid in hospital maintenance would be suitable for the provision of the best medical care for each individual in such widely different categories.

This bill includes under the definition of hospitals public health centers and general, tuberculosis, mental, chronic disease and other types of hospitals and related facilities. It is sufficiently flexible to be useful in whatever portion of the field of hospital care that need is demonstrated. It may, therefore, provide special facilities for many of the varied types of the chronic disease indigent groups.

The American Medical Association is primarily interested in the best medical care for all the people. It would seem inadvisable to attach to this bill any plan for financing maintenance such as would render the bill less flexible and impair its effectiveness in providing facilities for different groups under varying local conditions.

The bill now provides the means for the development of facilities for the best hospital care for all the people on the basis of needs as determined by investigation and by careful planning to meet those needs.

The suggestions for modifying and strengthening this bill do not alter the position of general approval. This bill conforms to the Platform adopted by the House of Delegates of the American Medical Association. It is endorsed by the Board of Trustees of the Association and deserves the support of all members and organizational units of the American Medical Association. Its authors are to be commended on their scientific approach to this important problem.

The American Medical Association stands ready to be of every assistance within its power to the Committee on Education and Labor, or its subcommittee, in further problems related to the Hill-Burton bill and its objectives.

Dr. Johnson's Statement

I appreciate the privilege of appearing before you as a representative of the American Medical Association and its Council on Medical Education and Hospitals. This council has been concerned for over forty years with the maintenance of medical care of a high quality, by fostering and stimulating high standards in the education of the physician. The responsibilities of the Council include rendering the services of consultation, advice and accreditation to medical schools and to hospitals engaged in educational programs at the levels of the internship and residencies in the specialties of medicine.

In addition, the Council promotes improved care in hospitals not engaged in the teaching of medical students, interns and residents. It maintains a register, now including 6,645 hospitals, as a service and protection to hospitals and the public, since the register includes only those hospitals which have been determined to measure up to certain minimum standards of hospital and medical service.

The Council on Medical Education and Hospitals is glad to offer to this committee and to such state agencies as might be

set up under this bill all the detailed information it collects and publishes annually concerning the hospitals of this country.

Primarily, I wish to second the remarks of Dr. Sensenich, whose testimony preceded mine, and who supported the bill under discussion. My remarks are merely supplementary to his. However, I should like to stress the opinion that the composition and powers of the Federal Advisory Council are extremely important. This body should consist of men who will command the full support of hospitals, physicians and the public. I think the council should be more than advisory and that it should be clothed with considerable authority, as seems to be the intent of the bill. Such an arrangement with powers of both veto and the initiation of action by the council is entirely consistent with good and efficient administration. There are numerous examples of such plans in business, industry and the professions.

I am very much impressed, and I think I can speak also for the Council on Medical Education and Hospitals, with the scientific approach manifested in this bill. The only *a priori* assumption made in this bill is that there is a maldistribution of hospital facilities in various parts of the country, with which assumption all must agree. The manner in which this faulty distribution is to be assessed conforms to the best scientific procedures. The proposed surveys, conducted by states agencies with the assistance of all groups concerned with hospital care, should provide the information requisite for an intelligent program of hospital construction in areas deficient in hospital facilities.

The sound approach to a solution of the problems of better distribution of medical care and hospital facilities on the part of the Committee on Education and Labor is reflected not only in the provisions of this bill but in the approach to these problems by your Subcommittee on Wartime Health and Education, under the chairmanship of Senator Claude Pepper. The interim report of this committee, published in January 1945, is an admirable document, containing invaluable information for the formulation of programs for improved medical care.

Certain of the procedures suggested in this report and in the Hospital Construction Bill are practically identical and equally sound. The report (page 17) recommends that "state programs should be drawn up by state health planning commissions" and "Before federal funds could be granted, however, overall state plans and individual projects should be reviewed and approved by the United States Public Health Service to make sure that they meet certain standards of construction, operation and complete, coordinated service." Equally significant is the recommendation that "grants to both public and voluntary institutions included in the plan would be administered through a state agency."

The provision of hospital and diagnostic services occupies a key position in the more equitable distribution of medical care. The days of the horse and buggy doctor are gone forever. Good medicine can be practiced only when hospital and related diagnostic facilities are available. Physicians may choose to locate in a community providing these facilities even though his income may be less than in areas lacking them. United States Public Health Service studies have shown that in areas of equal per capita income there may be three times as many doctors if hospitals are available as there are if such necessities of modern medical practice are lacking.

Studies conducted by the American Medical Association and by the Committee on Postwar Medical Service indicate that twice as many medical officers returning to civilian practice after the war will be willing to go to areas with deficient medical service if hospital and diagnostic facilities are provided, as compared with those willing to locate in medically deficient areas without such facilities.

If it is true that physicians cannot be attracted to rural and medically deficient areas without provisions for hospital facilities, it is equally true that hospitals without physicians are worthless. I should like to take this opportunity to stress to this committee what I have stated to your subcommittee: The present policies of governmental agencies regarding the supply of medical students is such that we shall be faced with a drastic reduction in the number of physicians after the war. Today the lack of provisions for the training of doctors is such that we may anticipate that many hospitals constructed under this bill, if it is passed, will have no physicians to man them.

In 1944 Army and Navy students entering our medical schools constituted 80 per cent of the entering classes. Twenty per cent were selected from civilian sources. It was becoming increasingly difficult for admissions committees to secure even this small percentage of qualified civilians from the sources available. In the year 1945 only about 53 per cent of the entering students will be Army or Navy students, increasing to 47 per cent the numbers which must be obtained from civilian sources. In 1946 there will be no Army students, and only approximately 10 per cent of the entering freshmen will do so under the Navy auspices. This increases those to be obtained from civilian sources to 90 per cent of the entering classes. One of two consequences is inevitable. Either the students will be of far poorer quality or they will be far fewer in number. We cannot afford either alternative. It will be impossible to obtain these large numbers of students from the category of men under 17, physically disqualified men, veterans and women. At the present time there is an utterly inadequate number of qualified individuals entering premedical training. I appreciate that a number of you are concerned with this problem. Conversations have been held with Senator Pepper regarding solutions to the problem and on Monday of this week Senator Ellender introduced a bill, S. 637, which was referred to the Committee on Military Affairs. This bill would seem to provide adequately for the exigency.

I wish to reiterate my appreciation of the privilege of expressing these views and to repeat that every facility of the Council on Medical Education and Hospitals is available to this committee in its efforts to implement and improve the bill under consideration. Finally, I wish to emphasize the opinion that this hospital construction bill deserves the support of all who are concerned with the extension and improvement of medical care in this country.

Postwar Medical Service

The Joint Committee on Postwar Medical Service met in Chicago on February 10. The meeting was called to order by the Chairman, Dr. Ernest E. Irons, at 10:05 a. m. The following members of the Joint Committee were present: Dr. Irvin Abell, Dr. Arthur W. Allen, Dr. Walter L. Biering, Dr. Frederick A. Collier, Mr. Graham L. Davis, Capt. William E. Eaton, Dr. Morris Fishbein, Dr. E. L. Henderson, Dr. Ernest E. Irons, Lieut. Col. H. C. Lueth, Dr. James M. Mason, Dr. James E. Paulin, Dr. George Morris Piersol, Brig. Gen. Fred W. Rankin, Rev. A. M. Schmitalla, S. J., Dr. H. H. Shoulders, Dr. LeRoy H. Sloan, Miss Mary Switzer and Dr. Olin West. Also present were Lieut. Col. R. D. Bickel, Lieut. Col. G. R. Gessner, Mr. J. W. Holloway Jr., Dr. Victor Johnson, Dr. Edwin P. Jordan, Col. B. R. Kirklin, Dr. Herman L. Kretschmer, Capt. Stephen J. McDonough Jr., Col. Hugo Mella, Col. F. V. Meriwether and Dr. R. L. Sensenich.

APPROVAL OF MINUTES OF DECEMBER 9, 1944 MEETING

The minutes of the meeting of the Committee held in Chicago on Dec. 9, 1944 were approved as circulated. It was moved by Dr. Abell after discussion by the Chairman that the minutes of the present meeting be circulated among the members of the Committee and a mail vote of approval taken, after which the minutes should be printed in THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION in order that the profession at large, including military personnel, might be informed of the progress of the Committee's work. The motion was duly seconded and carried, and it was understood that this would be the procedure to be followed in the future.

COMMITTEE MEMBERSHIP

The Chairman announced that the Board of Trustees of the American Medical Association had not yet had opportunity to appoint any one to represent the Association as a member of the Joint Committee in the place of Dr. Alan Gregg, resigned. It was announced by the Chairman that Dr. Walter W. Palmer, a member of the Committee representing the American College of Physicians, has presented his resignation because of new and important duties recently assigned to him. The resignation of Dr. Palmer was accepted with regret. The Chairman

stated that the American College of Physicians would appoint a successor to Dr. Palmer at an early date.

A communication from Surgeon General Parran requested that Col. F. V. Meriwether represent the U. S. Public Health Service whenever it is not possible for Dr. R. C. Williams or Dr. Warren F. Draper to attend the meetings of the Committee. The request was acceded to.

The Chairman stated that it was expected that the Advisory Board for Medical Specialties would name some one at its meeting to be held on February 11 to represent that organization on the Committee.

PROGRESS REPORT ON THE ANALYSIS OF QUESTIONNAIRES SENT TO MEDICAL OFFICERS

Lieut. Col. H. C. Lueth, Liaison Officer, stated that he had prepared a report which comprised more than fifty-eight typewritten pages and would at the moment present only the highlights, and that he hoped the Committee would approve having the complete report printed in THE JOURNAL.

Following is a brief summarization of Colonel Lueth's extremely informative report:

1. Future educational desires of medical officers on duty with the Army, Navy, Public Health Service and Veterans Administration were determined by a study of 21,029 returned questionnaires.
2. Nearly 60 per cent of the group, 12,534, wanted to take long courses (six months or longer) of further training in hospital or educational work. About one fifth of the group, 4,563, indicated they wished to take short courses (less than six months).
3. There were 3,922 medical officers, or 18.7 per cent of the group, who did not want any future training.
4. Requests for short courses included all specialties. The largest number of requests were for the following specialties in order of frequency: internal medicine, surgery, general review, obstetrics and gynecology, pediatrics, otolaryngology and ophthalmology.
5. The ten most popular special fields of training by means of long courses, in order of frequency of request, were surgery, internal medicine, obstetrics and gynecology, general review, psychiatry and neurology, pediatrics, orthopedic surgery, ophthalmology, radiology and otolaryngology.
6. Nearly two thirds of the group, 13,333, or 63 per cent, expressed a desire to become certified specialists. There were 3,324 medical officers nearly 16 per cent of the entire group, already certified by the American specialty boards. The remainder either did not care to be certified or did not mention their desires.
7. Nearly 40 per cent, 8,734 medical officers, came from private practice to the military services. Twenty two per cent, 4,640, came directly from internships, nearly 10 per cent, 2,191, came directly from residencies, and the remainder came from various types of practice. About 15 per cent failed to answer the question concerning their previous type of medical practice.
8. A comparison of the results of a pilot questionnaire and the present questionnaire was made. Long courses were requested by about one fifth more men in the final questionnaire than in the pilot questionnaire. Only two thirds as many men requested short courses in the final questionnaire as in the pilot. The difference was attributed to a change in the point of view of medical officers during the interval between the circulation of the questionnaire rather than to an error in sampling.

The report presented by Col. Lueth was accepted with thanks and commendation, and its publication at the earliest possible time was authorized.

REPORT ON BUREAU OF INFORMATION

Dr. Olin West stated that the Bureau of Information is now functioning but to a limited degree because of the extreme difficulty encountered in getting and keeping personnel. He stated that the Bureau had up to this time completed tabulations for thirty-eight states. Copies of the forms that are being used to secure information for the purposes of the Bureau and of the Instructions for Completing County Summary Sheets were submitted. Dr. West further stated that it was hoped and expected to have the cordial cooperation of the constituent state medical associations and the component county medical societies in the Bureau's effort to collect all pertinent information. He stated that inquiries are coming in from men on active duty but to a larger extent from men who have already been discharged and that he was confident that the Bureau will perform a helpful service. In reply to questions, Dr. West stated that the state medical associations had been informed of the work of the Bureau and many had expressed their willingness to cooperate; that instructions had been forwarded to the county medical societies; that some of the state societies have organized their own plans along these lines and that the Bureau will keep in close contact with all of them.

It was stated by Colonel Lueth that at present the problem is threefold: education, licensure and location. Information on

educational facilities is best handled in one central place, and Dr. Victor Johnson, Secretary of the Council on Medical Education and Hospitals, is attempting to perfect a plan toward this end so that inquiring medical officers can be informed of available opportunities for training. The question of location in specific communities is a local problem, which will be referred to the state agencies under close cooperation with the central file.

It was brought out in the discussion that there is much confusion in the states concerning the selection of hospitals and educational institutions under the provisions of the G. I. bill; that in some states the state department of education is advising the governors—in several states the organization of the work is behind and in others far ahead, and that it will be necessary to "tie up" the hospital, educational and licensing elements into a coordinating group. The Committee on Postwar Medical Service will be able to exercise such a coordinating action.

On motion of Dr. Paullin a committee was appointed to draw up recommendations on these questions. The committee, composed of Dr. Shoulders, Miss Switzer and Dr. Collier, presented the following resolution, which was adopted after discussion in which it was noted that under the G. I. bill the governors of the states are given control over all phases of education of veterans:

Resolved, That the chair be authorized to appoint a subcommittee to

1. Draw up recommendations to the governors of the several states concerning the medical education and postgraduate training of veterans under title II of Public Law No. 346, the Servicemen's Readjustment Act of 1944, with particular reference to the certification of institutions as qualified to give such training, and
2. Coordinate this effort with related medical and health problems in the state.

The Chairman announced the appointment of the subcommittee authorized under the foregoing resolution, as follows, stating that the new subcommittee would be expected to report back to the Joint Committee at its next meeting: Dr. H. H. Shoulders, Chairman, Dr. James E. Paullin, Rev. A. M. Schwitalla and Dr. Frederick A. Collier, with Miss Mary Switzer and Lieut. Col. H. C. Lueth as consultants.

PROGRESS REPORT ON EDUCATIONAL OPPORTUNITIES FOR MEDICAL OFFICERS

Dr. Victor Johnson presented a progress report on educational opportunities for medical officers, stating that it would be necessary to modify some of the estimates of available residencies on the basis of the analysis presented by Colonel Lueth. He stated that developments so far are promising and, if institutions and individuals involved continue with the same vigor and industry, the need will be met. Further reports will be made to the Committee.

During the discussion of Dr. Johnson's report, the question was asked if all of the residencies that would be available are of a type that would lead to certification by specialty boards, and the reply was that many would be second year training and that those hospitals initiating new residencies would have to be considered by the Council on Medical Education and Hospitals and by the specialty boards. This progress report will be continued at the next meeting.

REPORT OF SUBCOMMITTEE TO CONFER WITH THE SURGEONS GENERAL ON EDUCATION OF MEDICAL OFFICERS

(Dr. Collier, Chairman; Dr. Palmer; Father Schwitalla;
Dr. Johnson; Lieutenant Colonel Lueth)

Dr. Collier stated that his committee had nothing new to report. Father Schwitalla thought there were other questions the subcommittee might look into, and the subcommittee was continued to follow up such phases as it may consider necessary and report at the next meeting.

PROGRESS REPORT ON ARMY AND NAVY PLANS FOR RESIDENCIES AND GRADUATE STUDY

Capt. William E. Eaton had little to add to the report given at the last meeting when he had informed the Committee that the Surgeon General of the Navy had accepted certain plans for providing refresher courses for naval medical officers. Since then the professional division of the Bureau has been pursuing the classification of naval hospitals for internship and graduate training, and information relative to fellowships and residencies has been sent to officers in command. He stated

that an attempt is being made to improve methods of training that have been in effect for many years, and that activity in the whole matter is not yet completed.

Col. G. R. Gessner reported that the Army is readjusting the specialties practiced in its general hospitals and increasing and readjusting the size of the facilities now available. The Surgeon General has deferred any further action until a little firmer basis can be found on which to work before establishing a program of this type in Army hospitals. With the publication of Army Service Forces Circular No. 41 on Feb. 5, 1945 refresher professional training was authorized for officers of the Medical Corps who for the past twelve months or longer have been in administrative or command positions and who it is contemplated would be reassigned to professional duties. This training will be given in hospitals in both medicine and surgery and will be voluntary and available to any officer of the Medical Corps, with priority given to those who have been overseas. Such officers will be ordered to temporary duty to take the course of instruction on their own request and will be continued in active service.

Brig. Gen. Fred W. Rankin stated that the refresher course plan has nothing to do with the specialties, and that the Army has no intention of putting these men into a type of specialized training that would qualify them for specialty board certification.

Col. F. V. Meriwether, representing the Public Health Service, in place of Dr. R. C. Williams, stated that Dr. Williams had written him that in service hospitals there will be places for about thirty residencies, which will be available after the war and that the contemplated expansion may raise the number somewhat. He stated, with reference to education, that the Public Health Service is carrying on a training course in civilian schools for the benefit of Public Health Service officers, both regular and reserve, and that this is a more or less specialized public health training.

The chairman indicated that he would ask for further progress reports from each service at the next meeting.

REPORT OF WAR SERVICE AND POSTWAR PLANNING COMMITTEE OF AMERICAN DENTAL ASSOCIATION

The Chairman presented a statement he had received from Dr. C. Willard Camalier, Chairman of the War Service and Postwar Planning Committee of the American Dental Association, concerning the work of that committee, and stated that the invitation to the American Dental Association to send a representative to future committee meetings would be renewed.

REPORT OF SUBCOMMITTEE ON SURPLUS MEDICAL AND HOSPITAL SUPPLIES

(Dr. Palmer, Chairman; Dr. Irons; Dr. Fishbein;
Father Schwitalla; Miss Switzer)

Miss Switzer reported that since the last meeting of the Committee on Postwar Medical Service a Surplus Property Board had been appointed; that the U. S. Public Health Service had drawn up a plan for the disposal of surplus medical supplies, and that Dr. Paul M. Stewart, who had prepared the plan, had sent copies of it to the various professional organizations interested. After discussion, this subcommittee was continued with Father Schwitalla as Chairman in place of Dr. Palmer. Dr. George Morris Piersol was appointed a member of this subcommittee. The subcommittee was instructed to review the plan and to report back to the Joint Committee with recommendations to be presented to the American Medical Association.

LAWS CONCERNING TEMPORARY LICENSURE: PROGRESS REPORT

Dr. Walter L. Biering reviewed the previous actions of the Committee on Postwar Medical Service in the matter of temporary licensure and stated that the Federation of State Medical Boards was having a meeting within the next two days at which Dr. Paul C. Barton, executive officer of the Procurement and Assignment Service, is to present a discussion of the matter and bring to the attention of the delegates additional facts regarding the need in certain communities. He stated further that at the present time four states—Pennsylvania, Delaware, Nevada and Florida—have adopted statutes

involving temporary licensure; that no measures have been introduced in other state legislatures now in session, and that at the coming meeting of the Federation the attitude of that body toward temporary licensure should be determined. He gave a résumé of a report that Colonel Lueth is to make to the Federation delegates on information with respect to licensure that has been gleaned from the questionnaires sent to medical officers. Dr. Bierring stated that the Federation of State Medical Boards will be glad to do its utmost to bring about an equitable and desirable solution of the problem.

Colonel Lueth asked that approval of the Committee be given him to provide Dr. Bierring with the material on licensure obtained from the analysis of the questionnaires. This was granted.

REPORT OF SUBCOMMITTEE TO CONFER AND COOPERATE WITH VETERANS ADMINISTRATION CONCERNING EDUCATIONAL ASSISTANCE FOR VETERANS

(Father Schwitalla, Chairman; Drs. Collier and Palmer)

Father Schwitalla said that his subcommittee had nothing new to report. He stated that one big difficulty being encountered by most of the veterans is the availability of service in hospitals.

REPORT OF SUBCOMMITTEE ON ESTABLISHMENT OF MEDICAL CORPS IN VETERANS ADMINISTRATION

(Father Schwitalla, Chairman; Drs. Shoulders and Sloan)

Father Schwitalla reported that he had held a number of conferences in an effort to familiarize himself with the laws governing the Veterans Administration and the methods by which its medical personnel was being administered under Civil Service. The criticism of the medical care under the Veterans Administration has been increasingly vocal during the last few weeks. Examples were quoted. It was pointed out further that activities were in progress contemplating the reorganization of medical procedures under the Veterans Administration. A further report was promised for the next meeting of this committee.

SOURCES OF FUNDS TO BE USED FOR POSTWAR MEDICAL EDUCATION

Mr. Graham L. Davis informed the committee that the trustees of the W. K. Kellogg Foundation had recently approved a program under which financial assistance would be given over a three year period to a selected group of fifteen medical schools in the development of postgraduate educational opportunities for physicians in the areas they serve and to eight universities interested in establishing courses in hospital administration for both physicians and laymen.

OTHER POSTWAR PROPOSALS

Miss Switzer, who had been requested at the December meeting to gather material on the postwar planning of other organizations, reported that it had been impossible because of the pressure of other duties to go into this matter, and the Chairman stated that it would carry over to the next meeting.

PROGRAMS FOR ENROLMENT OF MEDICAL STUDENTS

Colonel Gessner and Captain Eaton both stated that they would gather information as definite as possible concerning the status of the Army Specialized Training Program and the Navy V-12 Program for presentation by themselves or by someone else more closely connected with these matters at the next meeting of the Committee on Postwar Medical Service.

LETTERS FROM MEDICAL OFFICERS IN SERVICE

The Chairman informed the Committee that letters of complaint that had been received from medical officers had been handled in the manner agreed on by the Committee at its December meeting.

INFORMATIONAL REPORTS

Association of American Medical Colleges.—The Chairman informed the Committee that Dr. Fred C. Zapffe, representing the Association of American Medical Colleges, could not be present but that he expected to attend the next meeting, at which time he would hope to provide the Committee with pertinent information.

Warime Graduate Medical Meetings.—In the absence of Dr. F. F. Borzell, acting chairman of the Central Committee

of the Wartime Graduate Medical Meetings, the Chairman stated that the work is being carried on; that the surgeons general had been appealed to for their aid in continuing the meetings under the wartime transportation restrictions, and that the details of the programs are being published regularly in *THE JOURNAL*, the *Annals of Internal Medicine* and the *Bulletin of the American College of Surgeons*.

Federation of State Medical Boards.—Dr. Bierring had nothing to report beyond what he had had to say earlier in the meeting with respect to licensure.

American Hospital Association.—Mr. Graham L. Davis stated that one of the major interests of the Hospital Association is Senate Bill 191, the Hospital Construction Act, or, as sometimes called, the Hill-Burton bill; that one of the purposes of the bill is to relocate physicians where they can be of the greatest use, which, as he understood it, was also one of the purposes of the Committee on Postwar Medical Service. He stated that, if it works out, the major part of the funds appropriated will be spent on hospitals in rural areas; that the federal government has a function and a responsibility for distributing the funds on the basis of need; that under the bill the Surgeon General of the U. S. Public Health Service would take into consideration the economic status in the particular area, and that some of the poorer states would receive 75 per cent assistance.

Mr. Davis requested as much support as possible from the American Medical Association toward the passage of the bill. He stated that the Hospital Association was cooperating very closely with the Surgeon General in the matter, and that thirty-three states now have in process studies of hospital needs.

Father Schwitalla informed the Committee that the other hospital associations had collaborated with the American Hospital Association in the preparation of the Hospital Construction Act and gave as points in its favor that while it centralizes responsibility in the hands of the Surgeon General it makes it incumbent on him to consult with his advisers; that the needs of the states are dominant in size of the funds allotted, and that the bill safeguards the relationship between the tax supported hospitals and the private hospitals.

Veterans Administration.—Col. Hugo Mella reported that the Veterans Administration is still working on the development of residencies; that a number of the Veterans hospitals had been surveyed by the American College of Surgeons for that purpose, but that it probably will not be possible to ascertain the complete number of residencies available until after the war. Each station after being surveyed has been asked to build up its plans.

Liaison Office.—Lieutenant Colonel Lueth announced that Lieut. Col. R. D. Bickel had been assigned to the Liaison Office at the American Medical Association headquarters and was now functioning. The Committee expressed its satisfaction at having Colonel Bickel present.

Procurement and Assignment Service.—Dr. James E. Paullin, member of the Directing Board of the Procurement and Assignment Service, stated that the Procurement and Assignment Service has contacted all discharge areas for physicians and is attempting through its state chairmen, to find out when a physician is being discharged and, if he has not already determined on a location, to furnish him with information as to understaffed communities.

CONTINUATION OF SUBCOMMITTEE

Dr. Collier suggested that the subcommittee of which he and Father Schwitalla were now the only members and of which Dr. Palmer had been chairman should be discontinued in favor of the larger subcommittee that had been appointed at this meeting. The Chairman stated that the subcommittee mentioned by Dr. Collier was a standing committee and that the new subcommittee was appointed to do a particular job and would be through when the job is done.

TIME AND PLACE OF NEXT MEETING

The next meeting of the Committee on Postwar Medical Service will be held at American Medical Association Headquarters in Chicago on March 17, 1945.

The meeting adjourned at 1:10 p. m.

H. H. SHOULDERS, M.D., Secretary.

Washington Letter

(From a Special Correspondent)

March 12, 1945.

Medical Science Eliminating Venereal Diseases

Such progress is being made by medical science against venereal disease that within five years syphilis and gonorrhea will be removed from the list of major health problems, according to Dr. Thomas Parran, Surgeon General of the U. S. Public Health Service. In an OWI report Dr. Parran stated that in the last eighteen months penicillin has had a "cure rate" of 96 per cent among all gonorrhea patients and also "cures some cases of infectious syphilis." The report dealt in detail with wartime health and problems to be expected when peace returns. There is no indication of a serious decline in the nation's mental and physical health, but Dr. Parran warned that the "lines against disease are lightly held." Shortages of medical manpower and the shifting population "leave us vulnerable to a breakthrough on many fronts." The shortage of doctors and nurses for civilians was expected to continue until both Germany and Japan are defeated. In the first ten years after the war the country will need 417,000 new hospital beds, including 191,000 for mental patients and 60,000 for the tuberculous. Installations of all the hospital beds and health centers which would be needed would cost almost \$2,000,000,000, Dr. Parran estimated. Rural areas would have an urgent need for small, well equipped hospitals and health centers.

Campaign Planned to End Venereal Disease by 1950

The plan to exterminate venereal disease by 1950 has been explained by Army, Navy and Federal Security Agency representatives to law enforcement, health, welfare, trade, industrial and civic officials in three key cities, Oklahoma City, San Antonio, Texas, and Columbia, S. C., Paul V. McNutt, Federal Security Administrator, has announced. Mr. McNutt said the fact that 40 per cent of venereal disease cases reported by the Army and Navy are acquired by enlisted personnel while on furlough indicated the need for a concerted community attack on prostitution, promiscuity and venereal disease. Until recently the venereal disease control program has been centered in war industry areas and cities near military cantonments, but the new developments are said to indicate that the problem is nationwide and not confined to war impacted areas. Mr. McNutt said that adding to the need for a new approach to the problem were recent advances in medical science in treating venereal infections, among which are rapid treatment methods for syphilis and the release of penicillin to civilian physicians for treatment of gonorrhea. Appearing at the three conferences were Thomas Devine, newly appointed director of the Social Protection Division, Office of Community War Services, Federal Security Administration; Mark McCloskey, director of the Office of Community War Services; Lieut. Col. Thomas H. Sternberg, director of the Venereal Disease Control Division, Office of the Surgeon General, War Department; Comdr. W. H. Schwartz, officer in charge of the Venereal Disease Control Section, U. S. Navy, and Dr. J. R. Heller, medical director in charge of the Venereal Disease Division, Public Health Service, Federal Security Administration.

Neuropsychiatric Institute Proposed for Capital

Construction of a \$4,500,000 plant in Washington by the Federal Works Administration to house a proposed National Neuropsychiatric Institute is provided in a bill introduced in the House by Representative Priest, Democrat of Tennessee. The institute would be organized under the U. S. Public Health Service "for the purpose of conducting research, investigations, experiments and demonstrations relating to the cause, diagnosis and treatment of neuropsychiatric disorders." It would also make grants in aid to universities, hospitals, laboratories and other public and private institutions and to individuals for research projects recommended by a national advisory mental health council provided in the bill. The Surgeon General of the U. S. Public Health Service would appoint six such council members from leading medical and scientific authorities. The plant would be situated in the capital and would include hospital buildings and facilities, together with buildings which

might be devoted to laboratory and experimental work. Under the bill the Federal Works Administration is "authorized to acquire, by purchase, condemnation or otherwise, a site or sites in or near the District of Columbia." Meantime Congress is considering a bill to permit Georgetown University to build a taller medical school hospital than the present law allows. The House District Committee has reported favorably on the request to increase the permitted building height from 90 to 110 feet. Columbia Hospital officials stress urgent need for a nurses' home and training school to be erected after the war.

House Votes to Draft Unmarried Graduate Nurses

By a vote of 347 to 42 the House of Representatives voted to register for the draft virtually all graduate nurses from 20 to 45 years of age, but permitting only unmarried nurses to be subject to induction. All nurses acceptable to the services will be tendered a commission as second lieutenants. All male nurses who are qualified are included, there being about 4,000, of whom 2,000 are in the services but not used as nurses. Widows and divorcees with dependent children are required only to register. Although the measure has yet to have Senate approval, the Army has indicated that it will not back down on its request for a nurse draft. A spokesman for Surg. Gen. Norman T. Kirk, who had just returned from a Pacific tour, said that a draft will produce needed nurses much faster than any voluntary recruitment system.

Miss Mary A. Roberts, editor of the *American Journal of Nursing*, said, in opposition to the measure, "If they draft nurses they will get draft service. You can't draft the spirit of nursing." Officials of the American Nurses Association, with representatives of the Army, Navy, Veterans Administration and Red Cross attending, conferred here to map out plans for a countrywide, direct recruitment campaign, which they said "will give nurses the information they need to straighten out earlier confusion." President Roosevelt, in a telegram to Katharine J. Densford, president of the American Nurses Association, has reasserted his stand on the need of nurse draft legislation as well as intensified efforts to obtain volunteers.

Medical Research to Be Pressed After War

Unsolved problems in medicine will be attacked with the same vigor and success in the coming years of peace as they have under the stimulus of war, Major Gen. James C. Magee, former Surgeon General of the Army, told the forty boy and girl finalists in the fourth annual science talent search conducted by the Science Clubs of America. "The mobilization of scientific talent devoted to medical research in the past few years," he said, "has been productive of enormous benefits to the military establishments and to mankind at large." Examples that he cited were the development of dried plasma and serum albumin as substitutes for whole blood, development of new sulfonamide drugs and the rediscovery and development of penicillin and of DDT. Counseling the youthful scientists to study "pure" science instead of the early tackling of practical problems, Dr. Roger Adams of the Office of Scientific Research and Development said that the men who had the "lucky breaks" in the development of penicillin and the sulfonamide drugs were chemists who were prepared by thorough general training. In connection with the need by industry of scientific knowledge, Maury Maverick, head of the Smaller War Plants Corporation, has urged a "crusade of science" through technical advisory services in every nation to keep industry the world over supplied with information.

Further Assistance for Blind Is Advocated

The armed forces program for blinded men, and efforts to legislate further aid for civilian blind, were lauded by Walter D. Kallenbach, blind evangelist and president of the National Association for the Advancement of the Blind, and Mary Cook Cowerd, blind soprano, who visited Washington to investigate pending legislation for postwar rehabilitation of the sightless. They stressed, however, that what is most vital is an educated public willing to give the blind a chance at normal and interesting careers. Blind persons now working at war jobs will be forced to depend on charity or to turn to selling shoe laces or making brooms, unless employers are openminded about hiring them. Mr. Kallenbach said that the men blinded in war constitute only 1 per cent of the blind population.

Capital Notes

Dr. George C. Ruhland, 65, completing his tenth year as District of Columbia health officer, announced that the Washington death rate had been reduced by 30 per cent since March 1, 1935. Personnel this year totals 2,163, compared with 246 in 1935.

A one week course in automobile driving for amputee patients is being conducted by the American Automobile Association at Walter Reed-Forest Glen Hospital.

The District of Columbia Medical Society has endowed the Davidson Lecture, in honor of Dr. Edward Young Davidson, with the interest from \$3,000 to be awarded biennially to a lecturer selected in competition. Essays are to be submitted under a *nom de plume* by physicians or other scientists working in the District.

Official Notes**BUREAU OF INFORMATION SENDS SUMMARY SHEETS TO STATE SOCIETIES**

State medical societies have recently been mailed summary sheets by the Bureau of Information for distribution to county societies. The information requested on these blanks relates to the number of physicians in active practice, certain economic conditions of the community and other appropriate details in the counties involved. The early distribution of these sheets to the county societies has been requested. The purpose is to obtain information which will be helpful to areas needing physicians, as well as to physicians seeking locations in which to practice. In order to be of service to communities and to the physicians, it is essential that these summary sheets be returned promptly. As soon as the data are supplied they can be used to aid medical officers separated from service. Lieut. Col. Robert D. Bickel, M. C., liaison officer to the American Medical Association from the Surgeon General's Office, is tabulating the information as soon as received, so that it can be made available at once to discharged medical officers. State and county society executives to whom these summary sheets are sent are urgently requested to expedite the completion and return of this material.

AMERICAN MEDICAL ASSOCIATION-N. B. C. NETWORK PROGRAM

Doctors Look Ahead on March 17 is to be devoted to an appeal to the women of the United States to meet the need for Army and Navy nurses and for medical technicians. Graduate nurses eligible for commission are urgently needed, and so are women members of the WAC who can be trained to perform simple technical procedures in the laboratories and thus release more highly trained personnel for the complicated procedures. Public service of this type has been performed frequently as a part of Doctors Look Ahead and previous American Medical Association and National Broadcasting Company programs.

Inquiries have been received by the Bureau of Health Education asking for transcriptions of Doctors Look Ahead. These network programs should not be confused with the transcribed programs also available. When a program has been broadcast on a nationwide network transcriptions are useless because no radio station will use an identical program a second time except in rare instances where programs of unusual merit are rebroadcast by request.

Doctors Look Ahead is heard on one hundred and twenty-three stations of the National Broadcasting Company network each Saturday at 4 p. m. Eastern War Time (3 p. m. Central War Time, 2 p. m. Mountain War Time and 1 p. m. Pacific War Time). Some stations may record the program and broadcast it at a time which suits their schedule better. Local newspaper radio-announcements should be consulted.

The next four programs deal with the following topics:

- March 17.—Women at War, in cooperation with the Office of War Information. The speaker will be Major Gen. Norman T. Kirk, Surgeon General, U. S. Army.
- March 24.—Juvenile Delinquency.
- March 31.—Accidents.
- April 7.—Tuberculosis.

Council on Medical Service and Public Relations**PUBLIC RELATIONS MEETING IN VIRGINIA**

A detailed discussion of public relations in all its phases was held by the Arlington County Society of Virginia on February 19. This meeting was attended by Dr. Joseph S. Lawrence, who described the Washington Office of the Council and answered questions concerning its work. Many physicians who attended expressed the desire that the Council develop an active public relations program "that would extend beyond the medical profession." The Arlington group also expressed a desire for definite information as to the development of voluntary insurance plans by state and county medical organizations.

The meetings which Dr. Lawrence has attended include the Legislative Conference of the Indiana State Medical Association, Secretaries' Conference of the Michigan State Medical Society, Conference of County Medical Society Secretaries and Editors of the Medical Society of the State of Pennsylvania, at which he spoke on "Realism in Public Relations," Toledo Academy of Medicine, the Cabell County Medical Society of West Virginia and the Arlington County Medical Society.

REGIONAL CONFERENCES DURING APRIL

The Council on Medical Service and Public Relations has scheduled three regional conferences on the West Coast during April. These conferences, which are to be held in Portland, Ore., San Francisco and Los Angeles, will complete a series of seven formal regional meetings and one informal session held by the Council. Representatives from eleven states and Alaska have been invited to attend the April meetings, each of which will include a morning program by speakers from various bureaus and departments of the American Medical Association and an afternoon question and answer round table discussion.

The schedule for these meetings follows:

- April 7. Northwest Conference, Portland, Ore., for Oregon, Washington, Idaho, Montana, Wyoming and Alaska.
- April 10. Northern California Conference, San Francisco, for Nevada, Colorado, Utah and northern California.
- April 13. Southern California Conference, Los Angeles, for southern California, New Mexico and Arizona.

In addition to the regional meetings the representatives of the American Medical Association will attend the House of Delegates meeting of the Oregon State Medical Association to be held April 8 in Portland. Representatives of the American Medical Association who will appear on the program will be Dr. John H. Fitzgibbon, Portland, Ore., Chairman of the Council; Dr. E. J. McCormick, Toledo, Ohio, Vice Chairman of the Council; Dr. Joseph S. Lawrence, Washington, D. C., Director of the Washington Office of the Council; Mr. J. W. Holloway Jr., Director of the Bureau of Legal Medicine and Legislation; Dr. Carl Peterson, Secretary of the Council on Industrial Health; Mr. Thomas A. Hendricks, Secretary of the Council on Medical Service and Public Relations, and Dr. Victor Johnson, Secretary of the Council on Medical Education and Hospitals, who is on the program for the San Francisco and Los Angeles meetings.

Woman's Auxiliary**Indiana**

The Woman's Auxiliary to the Indiana State Medical Association has urged all of its members to carry a copy of *Hygeia* to all Parents and Teachers Association and club meetings as a means of promoting its distribution. "Hygeia for Health" has been their suggested slogan.

New York

Dr. Nathan B. Van Etten and Mr. Dwight Anderson addressed the executive board meeting of the Woman's Auxiliary to the Medical Society of the State of New York January 24 and 25. The subject was "The Woman's Auxiliary and Medical Public Relations."

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Changes in Health Officers.—Dr. Albert F. Zipf, health officer of Sacramento County, has taken over the activities of the health officer of Sacramento, Dr. Herbert F. True, who retired because of ill health.—Dr. Wayne P. McKee has been named health officer of Ferndale in Humboldt County, succeeding Dr. Herbert C. James.

Seminar on Advanced Psychotherapy.—Dr. Frieda Fromm-Reichmann, director of psychotherapy at Chestnut Lodge Sanitarium, Rockville, Md., will give a seminar on advanced psychotherapy in San Francisco, March 26-April 2, under the auspices of the department of psychiatry of the University of California Medical School, Stanford University School of Medicine and the Mount Zion Hospital.

Research on Epilepsy.—A gift of \$2,000 from Mr. and Mrs. Eugene Fowler, Newcastle, has been made to the University of California Medical School, San Francisco, to be known as the Mother Lode Fund, with the request that it be used in research on epilepsy. The work will be carried out at the University of California Hospital under the direction of Dr. William J. Kerr, professor of medicine in the medical school.

Health Board to Observe Seventy-Fifth Anniversary.—On April 15 the seventy-fifth anniversary of the organization of the California State Department of Public Health will be observed. The department is said to be the second of the kind to be established in the United States, the first being the Massachusetts Department of Public Health (*THE JOURNAL*, January 20, p. 173). According to *California's Health*, the official bulletin of the state health department, the transcontinental railroad was completed only a few months before the creation of the board, and the enactment of progressive legislation to establish the California state board of health at this early period is a noteworthy event.

DISTRICT OF COLUMBIA

History of District Society Completed.—After two years of research Dr. John B. Nichols, Washington, chairman of the committee on history, has completed writing the history of the Medical Society of the District of Columbia from the time of its organization to the present day. Serving with Dr. Nichols on the committee on history have been Drs. William J. Mallory and Joseph S. Wall.

GEORGIA

Twenty-Five Years of "Georgia's Health."—The January issue of *Georgia's Health*, the official bulletin of the Georgia Department of Public Health, marked the completion of twenty-five years as a health education medium.

Hospital News.—The Emily Winship Woodruff Maternity Center of Crawford W. Long Memorial Hospital, Atlanta, has been opened. The nine story building was begun in 1941, but work was delayed because of lack of essential materials. The new unit has all the accommodations needed for the expectant mother, and patients coming to the center who are not able to pay regular fees may have services for \$27.50.

Ophthalmic Seminar at Emory University Canceled.—Emory University School of Medicine, Atlanta, announces the cancellation of the ophthalmic seminar scheduled to be held in Atlanta April 19-21, planned to honor the memory of Dr. Abner Wellborn Calhoun, the first professor of ophthalmology at Atlanta Medical College, which was established in 1854 and which in 1915 became the school of medicine of Emory University. Dr. Calhoun was born April 16, 1845 and died Aug. 21, 1910.

IDAHO

Physician Senator Resigns.—Dr. Charles A. Robins, St. Maries, has resigned as state senator because he is the only physician and surgeon in Benewah County, according to *Northwest Medicine*.

State Medical Board.—Drs. Hoyt B. Woolley, Idaho Falls, Robert L. Rodwell, Nampa, and Glenn McCaffery, Kellogg, were recently appointed members of the state board of medical examiners. Reappointments include Drs. George C. Halley, Twin Falls, Samuel M. Poindexter, Boise, and Clifford O. Armstrong, Moscow.

ILLINOIS

Chicago

New Health Editor of Chicago Tribune.—Dr. Theodore R. Van Dellen, medical consultant to the *Chicago Tribune* since 1941, has been appointed health editor, succeeding the late Dr. Irving S. Cutter. Dr. Van Dellen graduated at Northwestern University Medical School in 1936.

Branch Society Meeting.—The North Side Branch of the Chicago Medical Society will meet at the Drake Hotel, April 5. Speakers will be Dr. Edwin C. Hamblen, Durham, N. C., on "Functional Uterine Bleeding"; Frank X. Gassner, D.V.M., Fort Collins, Colo., "Some Endocrine Problems in Veterinary Medicine," and Warren O. Nelson, Ph.D., Iowa City, "Endocrine Factors in the Development and Function of the Breast."

Readjusting with the Returning Servicemen.—The readjustment from war to peace must take into consideration the emotional as well as the physical and material needs of soldier and civilian; the conditioning of the civilian for the soldier's return and the renaturalization of the soldier was the theme of the thirty-sixth annual meeting and two day institute sponsored by the Illinois Society for Mental Hygiene, March 8-9 at the Knickerbocker Hotel. Among the speakers were:

Dr. Rudolph G. Novick, Elgin, Ill., medical director, Illinois Society for Mental Hygiene, The Conference Theme.

Col. William J. Bleckwenn (MC), He Takes Off His Uniform.

Lieut. Comdr. Louis A. Schwartz (MC), Emotional Disorders in the Disabled Veteran.

Francis Roscerance, Ph.D., Evanston, Emotional Aspects of Educational Problems.

Harold Taylor, employment manager, Hawthorne Works, Western Electric, Emotional Aspects of Industrial and Employment Problems.

Dr. Gregory Zilboorg, New York, Psychosocial Paradoxes of Returning from the War.

Marguerite G. Nordman, director of home service, St. Louis chapter, American Red Cross, Helping in the Readjustment of the Soldier and His Family.

Dr. George S. Stevenson, New York, Rebirth of a Civilian.

Three round table discussions covering industry, education and religion formed a part of the second day's session.

INDIANA

Constitution Amended to Permit Physician on Board.

—For the first time since the General Hospital Association of Elkhart was organized in 1909, a doctor of medicine has been elected to its board of directors. It was necessary to change the constitution to provide for the addition of Dr. David D. Todd, head of the surgical section of the medical staff at the Elkhart General Hospital, who was chosen to succeed Mrs. Cora Elliott, secretary of the board. To place Dr. Todd on the board the constitution was amended to read "any citizen over the age of 21 years, residing in the city of Elkhart, shall be eligible to serve as a director of the association." The exception removed from the constitution read "excepting physicians, surgeons, dentists, osteopaths, the practitioners of any healing cult or science, and clergymen." Newspapers reported that Dr. Todd made the motions for the amendments, stating that a physician on the board could help with the administration of the hospital, get cooperation of the nursing staff as well as the nonprofessional staff of the hospital, maintain the good will of the hospital and assist in solving the medical problems of the future.

Governor Outlines Health Program.—On January 25 Governor Gates outlined legislative program of his administration for general expansion of the state's health service facilities, according to the *Indianapolis Times*. Among his recommendations was the reorganization of the state board of health, increasing its membership from four to seven to include three physicians, one dentist, one sanitary engineer, one pharmacist and one woman who has "demonstrated interest in public health." The bill carrying this recommendation, now passed and signed by the governor, includes a nurse and a veterinarian as members of the board, bringing the total to nine. Other recommendations include:

Creation of full time health boards or departments in all towns and smaller cities.

Creation of a state board to recodify all state health laws for enactment by the 1947 legislature.

Legislation authorizing cities and counties to create funds for the construction of health centers and clinics through endowments, subscriptions or direct appropriations.

Creation of two new divisions under the state health board, one for dealing with diseases of aged persons and a dental health department.

Strengthening of laws on tuberculosis quarantine, compelling persons unwilling to be committed to be examined by a three physician board.

An inspection service and licensing by state health board of hospitals practicing medicine, surgery and obstetrics, extending control over present maternal and child health service.

Expansion of the stream pollution control board from six to seven members.

IOWA

State Meeting Canceled.—The Iowa State Medical Society has canceled its annual session, scheduled to be held in Des Moines April 19-20.

KANSAS

Infectious Jaundice in Riley County.—Twenty-seven cases of infectious jaundice were recently reported in Riley County, 16 from Manhattan and 11 from Ogden. The local health department, of which Dr. Fred P. Bestgen, Manhattan, is director, and the laboratory at the Kansas State College of Agriculture and Applied Science, Manhattan, assisted with diagnostic procedures, with consultation service from Dr. Clarence H. Kinnaman, Topeka, state epidemiologist, and C. A. Hunter, Ph.D., Topeka, director of laboratories, state board of health, according to the *News Letter*. Of the Riley County cases 14 were in children between the ages of 5 and 15 years and there were 4 cases in children less than 5 years of age, 4 cases in persons 25-29 years of age, 2 in the 50-54 year age group and 1 case each in the 15-19, 45-49 and 70-74 year age groups. Although most families in which cases occurred owned dogs as family pets and the highest incidence was in children from 5 to 14 years of age who would be likely to play with dogs, health authorities emphasized the present need for rat control and stressed careful washing of all food-stuffs to remove possible contamination from both rats and dogs.

LOUISIANA

State Meeting Postponed.—The annual meeting of the Louisiana State Medical Society, scheduled to be held in New Orleans April 13, has been postponed.

Hospital News.—The new War Memorial Hospital, Leesville, was recently opened at a cost of \$250,000. The unit is one story high with buff brick exterior.

University News.—Beginning with the session of 1944-1945, Tulane University of Louisiana School of Medicine, New Orleans, broke the tradition of starting the freshmen students with the dissection of the human body by substituting instruction in biochemistry instead of gross anatomy, which has heretofore been delayed until the study of physiology is started in the latter part of the first year. The *Bulletin* of the Tulane Medical Faculty states that it is believed that the change will make for an easier transition from the premedical studies to those of the medical curriculum.

MASSACHUSETTS

Hospital News.—Plans have been announced to construct a new building for the New England Deaconess Hospital, Boston, to be eight stories high and accommodate 200 patients. A campaign has been started by the hospital to raise \$1,500,000 to finance the project.

Frederick Bailey Named Health Commissioner of Boston.—Dr. Frederick J. Bailey, Boston, who has been associated with the Boston Health Department almost continuously for the past forty years, was recently appointed health commissioner of Boston to succeed Dr. George Lynde Gately, now in the Navy. Dr. Bailey, who graduated at Harvard Medical School, Boston, in 1903, has been serving recently in the U. S. Naval Reserve.

Personal.—William L. Campbell, formerly of Berlin, N. H., has been appointed head of a new department devoted to education and research in food technology at the Massachusetts Institute of Technology, Cambridge. The new department will expand and extend the scope of the Samuel Cate Prescott Laboratories of food technology, of which Bernard E. Proctor, Ph.D., was recently appointed director (*THE JOURNAL*, February 10, p. 346).

MICHIGAN

Personal.—Dr. Emil Amberg, Detroit, was recently elected to emeritus membership in the Michigan State Medical Society. —Dr. William M. LeFevre has been appointed a member of the Muskegon board of health to succeed the late Dr. Samuel A. Jackson.

Raymond Hussey Honored.—Dr. Raymond Hussey, newly appointed dean of the School of Occupational Health and professor of preventive medicine at Wayne University Medical Science Center, Detroit (*THE JOURNAL*, February 17, p. 411), was guest of honor at a dinner February 28 sponsored by the committee on medical education of the Wayne County Medical Society. Dr. Hussey spoke on "The Future Development of Industrial Health Education in the United States."

Health Officers Association Created.—Dr. Clarence D. Barrett, Mason, was elected president of the recently organized Michigan Health Officers Association, which was set up to advance public health principles and practices, to recommend standards of employment based on education, training and experience, to make community health protection more complete and certain through study and conference with proper authorities and to strive for a good program for the retirement of health officers and staff members with pension and to seek legislative enactment to this end. Other officers include Drs. Otto K. Engelke, Ann Arbor, vice president, and Vladimir K. Volk, Saginaw, secretary-treasurer.

Industrial Medical and Surgical Conference.—The third annual postgraduate industrial medical and surgical conference, sponsored by the committee on industrial health of the Michigan State Medical Society in cooperation with the department of postgraduate medical education of the University of Michigan, will be held in Detroit, April 5. Among the speakers will be:

Drs. Winfred B. Harm and Earle A. Irvin, Detroit, Industrial Medicine—Cooperation Between Industrial Physicians and Private Practitioners.
Theodore P. Ryan, LL.B., Lansing, Problems Arising from Michigan's New Compensation Law.
Dr. Dudley A. Irwin, Pittsburgh, Treatment and Prevention of Silicosis with Aluminum Powder.

At a symposium on postwar problems of industrial health and medicine, at which Dr. Raymond Hussey, Detroit, will be the leader, participants include:

O. L. Beardsley, Detroit, Selective Placement of Workers—A Personnel Manager's Viewpoint.
Dr. Fenn E. Poole, Burbank, Calif., Selective Placement of Workers—A Medical Man's Viewpoint.
Dr. H. Graham Ross, Montreal, Psychosomatic Medicine in Industry.
Major Roy P. Warren, S. C., Health Maintenance Engineering in Relation to Industrial Health.

Presiding at the sessions will be Drs. Andrew S. Brunk, Detroit, president of the state medical society, Kenneth E. Markuson, Lansing, chairman of the state industrial health committee, general chairman, and Patrick L. Ledwidge, Detroit.

NEW JERSEY

Personal.—Dr. Leslie Robert Angus, senior psychiatrist with the Institute of Living, Hartford, Conn., has been appointed medical director of the Bancroft School, Haddonfield.

Colonel Ash to Give Martland Lecture.—Col. James E. Ash, director, Army Institute of Pathology, Office of the Surgeon General, Washington, D. C., will deliver the tenth Harrison S. Martland Lecture at the Academy of Medicine, Newark, March 28, under the auspices of the Essex County Anatomical and Pathological Society. Colonel Ash's subject will be "The Army Institute of Pathology and Its Contribution to the Study of Diseases Prevalent in the Military Air Group."

NEW YORK

Meeting Canceled.—The Medical Society of the State of New York has canceled its annual meeting, scheduled to be held in Buffalo April 30-May 3.

Seminars on Rheumatic Fever.—The St. Francis Sanatorium for Cardiac Children, Roslyn, opened a course of seminars on rheumatic fever and rheumatic heart disease March 8 to continue once a week on Thursday. Demonstration of clinical material will be stressed at these conferences. Dr. Leo M. Taran is medical director of the sanatorium.

Resignations in State Health Department.—Dr. Augustus B. Wadsworth, director of the division of laboratories and research, New York State Department of Health, Albany, retired January 31 after thirty-one years of continuous service. Dr. Marion F. Loew, assistant director of the division of maternity, infancy and child hygiene since 1936, retired from state service February 23. *Health News* reports that she will go to Antioch College, Yellow Springs, Ohio, to join the Samuel S. Fels Research Institute.

Graduate Lectures.—The Cortland County Medical Society will be addressed April 20 by Dr. Edward C. Hughes, Syracuse, on "Hemorrhages of the Latter Part of Pregnancy" and Dr. Orren D. Chapman, Syracuse, May 18, on "Diagnosis and Treatment of Meningitis." The Jefferson County Medical Society will be addressed April 12 by Dr. Clarence E. de la Chapelle, New York, on "Management of Acute Cardiovascular Emergencies." These lectures are sponsored through the cooperation of the state medical society and the state department of health.

New York City

Caroline Zachry Dies.—Caroline B. Zachry, Ph.D., director since May 1942 of the bureau of child guidance of the city school system, died February 22, aged 50.

Appointment of Medical Officers in Life.—The board of directors of the Life Insurance Company has made the following appointments, effective February 20:

- Dr. Albert O. Jimenis to associate medical director.
- Dr. Haynes H. Fellows to associate medical director.
- Dr. Anthony J. Lanza to associate medical director.
- Dr. George M. Wheatley to be assistant vice president, welfare.

Bequest to Finance Work in Psychiatry.—The Lester N. Hofheimer estate has granted \$35,000 to Columbia University College of Physicians and Surgeons to finance the first year's expenses of the newly created Psychoanalytic and Psychosomatic Clinic for Training and Research (THE JOURNAL, Sept. 23, 1944, p. 247). The grant comes from the estate of Lester N. Hofheimer, first lieutenant, Army Air Forces, who was killed in India in December 1943 and is the first made in the field of psychiatry under the lieutenant's will, according to *New York Medicine*. Lieutenant Hofheimer left the bulk of his estate, approximating one million dollars, to philanthropic enterprises, the distribution of which is left to the discretion of three executors (THE JOURNAL, June 24, 1944, p. 588).

Deaths from Carbon Monoxide.—Escaping gas containing carbon monoxide killed 325 persons in New York City during 1944, 289 of the deaths occurring in homes. In a release to the press Dr. Ernest L. Stebbins stated that these are preliminary figures and that when the final returns were completed the total would probably be somewhat higher. The National Safety Council on January 15 reported that gas asphyxiation fatalities have increased 50 per cent since the beginning of the war. Gas killed 1,800 Americans in their homes during 1943, council statistics show. Carbon monoxide, dangerous because it is both colorless and odorless, caused most of these deaths. One fifth of these fatalities were caused by coal gas, mostly carbon monoxide, produced when stoves, furnaces or flues are defective or when dampers are not properly set. About half of the deaths were caused by illuminating gas. Makeshift arrangements to supplement rationed heat and badly worn equipment were named by the council as contributors to the increase. Poorly adjusted burners and leaky fittings are chief offenders.

NORTH CAROLINA

Personal.—Dr. James S. Gamble has been named superintendent of the Reeves Gamble Hospital, Lincolnton, and local surgeon for the Seaboard and Southern Railways succeeding his father, the late Dr. John R. Gamble.—Dr. Sigma V. Lewis has been appointed director of the Burke-Caldwell district health department with offices in Lenoir.

Pellagra Declines.—Fewer persons died of pellagra in North Carolina in 1944 than during any other year for which the records are available. For the entire year only 64 such deaths were reported to the state board of health and an all time low rate of 1.7 was recorded. During the previous year there were 110 deaths from this malnutrition disease, and the rate was 3.0. These figures are in sharp contrast with those of former years. In 1918, the peak year of United States participation in the first world war, the pellagra death rate in North Carolina was 25.7, and in 1929 and 1930, which were depression years, the rates rose to 32.0 for each year, after a recession that followed the war and coincided with "prosperity." With the easing of the depression the pellagra death rate again began to decline, but not to any considerable degree until after 1937. The rate that year was 13.0, but in 1938 it dropped to 7.3, and the down trend has been sustained since that time, being 5.9 in 1939, 4.7 in 1940, 3.8 in 1941, 3.0 in 1942 and 1943 and 1.7 in 1944, the lowest ever recorded. The general death rate in the state was 7.9 as compared with 8.1 the previous year. The infant mortality rate dropped to 44.7, a new all time record, and the maternal death rate fell to 2.9, also a new low rate for the state. A birth rate of 24.7 was recorded.

OKLAHOMA

State Meeting Canceled.—The Oklahoma State Medical Association has canceled its annual meeting, scheduled to be held in Oklahoma City.

Society Resumes Publication of Bulletin.—The Garfield County Medical Society recently voted to resume publication of its monthly journal, the *Bulletin*. Publication of the bulletin was suspended when Dr. Roscoe C. Baker, Enid, entered the

armed forces but, according to the *Journal of the Oklahoma State Medical Association*, he will have charge of the work when it is again printed.

County Society Enlarges Quarters.—The executive offices of the Tulsa County Medical Society, 1202 Medical Arts Building, Tulsa, have been remodeled following an addition of a large room to the society quarters. The medical library has been expanded, and separate offices have been constructed for the executive secretary. The medical credit bureau has also been enlarged. The Tulsa County Medical Society now utilizes the entire twelfth floor of the Medical Arts Building.

PENNSYLVANIA

Philadelphia

Dr. Blechschmidt Honored.—Dr. Dorothy C. Blechschmidt was honored at a luncheon recently given by the One Hundred Club of Philadelphia in recognition of her work at the Blechschmidt Cancer Prevention Clinic, located in the Doctors Hospital. The clinic was organized about three years ago and is named for Dr. Blechschmidt, who serves as its chief of staff. It is financed by a membership of almost 1,000 women; no salaries are paid, for all the service is voluntary (THE JOURNAL, July 1, 1944, p. 665). The One Hundred Club is an organization composed of past and present presidents of various organizations in Philadelphia.

Annual Health Institute.—The woman's auxiliary to the Philadelphia County Medical Society will hold its fifteenth annual health institute April 10 in the auditorium of the Philadelphia County Medical Society. "Health Problems in Wartime" will be the theme of the meeting. Among the speakers will be:

- Col. Leonard G. Rowntree, M. C., Physical Fitness.
- Dr. Rufus S. Reeves, Poliomyelitis.
- Dr. Samuel B. Hadden, War Neuroses.
- Mrs. David W. Thomas, president of the Woman's Auxiliary to the American Medical Association.
- Hon. Nochem S. Winnet, judge of Municipal Court, The Judge Looks at Juvenile Delinquency.
- Dr. John H. Stokes, Problem of Human Relations as It Relates to Social Hygiene.
- Lieut. Col. James B. Brown, M. C., Reconstructive Surgery.

The session will also be addressed by Dr. Charles L. Brown, president of the Philadelphia County Medical Society, and Dr. William Bates, president of the Medical Society of the State of Pennsylvania. Mrs. S. Dale Spotts, president of the woman's auxiliary of the county society, will preside at the meeting.

Colonel Ravdin Named to Barton Professorship.—Col. Isidor S. Ravdin, M. C., who is in command of an army hospital in India while on leave of absence from the University of Pennsylvania School of Medicine, has been appointed John Rhea Barton professor of surgery. Colonel Ravdin graduated at the University of Pennsylvania School of Medicine in 1918 and has been Harrison professor of surgery and director of the Harrison department of surgical research in the school of medicine since 1936; prior to that time he held other faculty posts, including the J. William White professorship of surgical research. Dr. Eldridge L. Eliason, who is now the Barton professor and a member of the faculty since 1907, planned to retire on July 1 but will continue for the present while Colonel Ravdin is on active service. Dr. Eliason graduated at the University of Pennsylvania School of Medicine in 1905 and joined the teaching staff as assistant instructor in surgery. In 1925 he was appointed professor of clinical surgery in the school of medicine and the following year to a similar post in the graduate school of medicine of the university. He has been John Rhea Barton professor of surgery since 1936 and professor of surgery in the graduate school of medicine since 1938.

UTAH

Three Man Committee Acts as Dean.—A committee of three members of the faculty of the University of Utah School of Medicine, Salt Lake City, has been appointed to direct the activities of the school, pending the appointment of a dean to succeed Dr. A. Cyril Callister, resigned (THE JOURNAL, February 10, p. 347). Members of the committee include Dr. Charles E. McLennan, professor and head of the department of obstetrics and gynecology, chairman, and Dr. Hyrum L. Marshall, professor and head of the department of public health and preventive medicine, and Chester A. Swinyard, Ph.D., associate professor of anatomy. The committee will serve in all administrative affairs of the school of medicine until the appointment of a new dean. Dr. Callister plans to return to the private practice of medicine, it was reported.

WASHINGTON

Reject Proposed Ban on Foreign Physicians.—A proposed ban by the King County Medical Society on membership of physicians educated outside the United States and Canada was rejected unanimously at a meeting of the society January 8. It was stated that the proposal was submitted with the idea that it is difficult in these times to check on the credentials of men educated in European medical schools. It was decided, however, that such action would be untimely.

Research Foundation Set Up in County Hospital System.—The establishment of the Foundation for Medical Research of the King County Hospital System was announced at a recent meeting of the medical board of the system in Seattle. According to the *Bulletin* of the King County Medical Society it is anticipated that the fund, of which \$25,000 is now available, will be of considerable interest to the community, as it will be open for donations and bequests to any one interested in promoting the advancement of knowledge in medicine, surgery and all of their branches. Administration of the fund will be placed directly in the hands of a committee of local physicians working under the direction of the board of trustees of the county hospital, and it is anticipated that it will grow to have considerable significance in cooperating in the development of research at the new medical-dental school of the University of Washington.

WEST VIRGINIA

Proposed Merger of Health Departments.—Merger of the health departments of the city of Charleston and Kanawha County has been recommended by Dr. Elias W. Langs, U. S. Public Health Service Reserve, who conducted a survey and made an exhaustive study of the matter early in the winter in cooperation with Dr. John E. Offner, Weston, state health commissioner. The survey, which followed the recommendation of the state medical association's fact finding and planning committee that all city health departments be merged with the health department of the county in which the unit is located, was made with the full consent of city and county officials. In his report Dr. Langs recommended that within two years after the merger all affiliated health agencies, including the entire school health service, be consolidated with the unit, which would be under the direction of an experienced health officer. Administration would be under the supervision of a nonpartisan board of health.

WISCONSIN

Position Available as Director of Laboratories and Research.—The Milwaukee City Service Commission announces an examination to fill the position of director of laboratories and research in the city health department. Additional information may be obtained from the Milwaukee City Service Commission, Room 716, City Hall, Milwaukee 2.

Lewis Danziger Wins Rogers Essay Contest.—Dr. Lewis Danziger, on the staff of the Milwaukee County Hospital for Mental Diseases, has been announced as the winner of the Rogers Memorial Essay Contest, sponsored by the Milwaukee Academy of Medicine and founded by the Rogers Memorial Sanitarium. Dr. Danziger won the first prize of \$200 for his manuscript on "Anoxia and Compounds Causing Mental Disorders in Man." The contest was established in 1943 (*THE JOURNAL*, June 19, 1943, p. 553).

Personal.—Dr. Mark A. Bailey was recently appointed health officer of Fennimore.—Dr. Valentine A. Gudex, Milwaukee, has resigned as deputy state health officer; he was connected with the state board of health for twenty-six years.—Edwin Broun Fred, Ph.D., professor of bacteriology at the University of Wisconsin, Madison, since 1943 dean of the college of agriculture, previously for nine years dean of the graduate school, has been elected president of the university to succeed Clarence A. Dykstra, LL.D., who has become provost of the University of California at Los Angeles.

Diagnostic Center Proposed.—The tentative plans to develop a diagnostic center in Wisconsin have been approved by an advisory committee of the state medical society to the state department of public welfare and its committee on public policy. The University of Wisconsin, Madison, has also pledged its cooperation. As outlined in the state medical journal, the building would be constructed in Madison close to the State of Wisconsin General Hospital to accommodate 150 persons who have been committed to one of the certain

state correctional institutions and for occupancy by persons placed on probation to the department of public welfare. The administration of the center is to be the function of the department of public welfare. The center would provide for the complete medical examination of all those, except those going to either Mendota or Winnebago, who are committed to the care of the department of public welfare and whom the state will either attempt to adjust to a more conventional behavior or resort to a useful functioning capacity. It is expected that the building would cost about \$700,000 and that about \$116,000 would be needed to maintain it annually. The new project would care for the large group of young people who come under the care of the department of public welfare for whom no adequate medical facility now exists and who cannot be accommodated by the two state hospitals concerned with mental diseases. It is believed that the proposed diagnostic medical center and its location near the medical school of the state university would assist the state department of public welfare in developing a program of rehabilitation in this class of young people for whom accommodations are not otherwise available.

HAWAII

Industrial Group Changes Name.—The Territorial Association of Plantation Physicians is the name by which the component society of the American Association of Industrial Physicians and Surgeons, heretofore known as the Hawaiian Society of Industrial Physicians and Surgeons, will be known.

Graduate Course.—A postgraduate course was conducted for the Honolulu County Medical Society, January 8-14, in the Mabel Smyth Auditorium, Honolulu. Members of the armed forces stationed in Honolulu presented the program, which included round table discussion on the specialties and a symposium on cardiovascular disease, neuropsychiatry, cancer and diseases of the chest.

Hawaii's Medical Service Plan.—A program of medical and hospital service has been functioning in Honolulu under the auspices of the Honolulu County Medical Society and now has a participating membership of nearly 10,000 and is pointed in a direction of complete coverage. Members of the Territorial Medical Association of Hawaii are considering expansion of the plan, currently restricted to the island of Oahu, throughout the territory. Mr. Reginald W. Carter, general manager of the Hawaii Medical Service Association which operates the Honolulu Medical and Hospital Plan, is traveling throughout the United States visiting various installations which deal with medical and hospital care. His tour included several days at the headquarters of the American Medical Association studying the program of the Council on Medical Service and Public Relations. Information concerning the Hawaii plan, which was established in 1938, may be obtained by addressing Mr. Carter at Room 417, Hawaiian Trust Building, Honolulu.

GENERAL

Society News.—At a special meeting of the board of trustees of the United States Pharmacopoeial Convention Robert L. Swain, Sc.D., New York, was elected chairman to fill the vacancy caused by the recent death of former chairman Evan-der F. Kelly, Sc.D. Dr. Swain was elected a member of the board in 1936 and was reelected by the convention at its 1940 meeting in Washington, D. C.

Meetings Postponed.—At a meeting of the council of the American Psychiatric Association in Chicago, February 26-27, it was voted to postpone the annual session of the association, scheduled to be held in Chicago May 21-24, until August 26. Dr. Winfred Overholser, St. Elizabeths Hospital, Washington 20, D. C., is secretary-treasurer of the American Psychiatric Association.—The executive board of the American Public Health Association has voted to postpone the seventy-fourth annual meeting of the association, scheduled to be held in Chicago the week of September 17.

National Noise Abatement Week.—April 29 to May 5 has been designated National Noise Abatement Week. Again the National Noise Abatement Council will make its annual awards for civic achievements in the abatement of needless noise, consisting of one grand national award and four city population class awards. A gold plaque symbolic of the award will be presented to the grand national award winner, and a silver plaque will be given to the winning city in each population group. These plaques, designed by the eminent sculptor Rene Paul Chambellan, depict Aeneas, hero of Vergil's *Aeneid*, overcoming the many headed monster Cerberus, who guarded

the gates to Hades. In vivid bas-relief Aeneas is portrayed in the act of hurling bits of drugged food into the jaws of the beast, which, according to Vergil's tale, effectually quells Cerberus, who falls asleep.

Information Bulletin on Rehabilitation and Reconditioning.—The Baruch Committee on Physical Medicine is making available without charge a bulletin of information on "War and Postwar Rehabilitation and Reconditioning." The booklet, which may be obtained on request through the committee, 597 Madison Avenue, New York 22, contains up-to-date reports on the recent activities in reconditioning and physical rehabilitation from the Army Reconditioning Division, from the Rehabilitation Division of the Medical Department of the Navy, from the Convalescent Training Division of the Army Air Forces, from the Division of Physical Medicine and Medical Rehabilitation of the Veterans Administration, from the Committee on Convalescence and Rehabilitation of the National Research Council and from the Federal Security Agency concerning the Federal-State Program of Vocational Rehabilitation for the Civilian Disabled. A report concerning the activities of the Baruch Committee appeared in *THE JOURNAL*, Dec. 9, 1944, page 973.

Meetings Canceled.—The National Tuberculosis Association has canceled its annual meeting, which was to be held in Buffalo June 13-15. The *Bulletin* of the National Tuberculosis Association states that the board of directors of the association, the executive committee of the National Conference of Tuberculosis Secretaries and the council of the American Trudeau Society will hold meetings on dates to be announced later.—The Federation of American Societies for Experimental Biology has canceled its annual session, which was to be held in Cleveland May 8-10. The federation is composed of the American Physiological Society, American Society of Biological Chemists, American Society for Pharmacology and Experimental Therapeutics, American Society for Experimental Pathology, American Institute of Nutrition and the American Association of Immunologists.—The American Society for Clinical Investigation has canceled its annual meeting, which was to have been held in Atlantic City May 7. Dr. Wesley W. Spink, University Hospitals, Minneapolis 14, is the secretary.

Snow Medal Awarded to Merritte W. Ireland.—The presentation of the William Freeman Snow Medal for distinguished service to humanity to Major Gen. Merritte W. Ireland, formerly surgeon general of the U. S. Army, was a feature of the thirty-second annual meeting of the American Social Hygiene Association in Chicago recently. Honorary life memberships in the association were presented to Drs. Bertha M. Shafer, Chicago, director, Illinois Social Hygiene League, and Lieut. Col. Donald H. Williams, chief, division of venereal disease control, National Department of Health and Welfare, Canada. Thomas Parran, surgeon general of the U. S. Public Health Service, addressed a session on "Social Hygiene, the Past Five Years and the Next Five Years." The thirty-second annual session of the American Social Hygiene Association was held in conjunction with the Chicago Conference on Social Hygiene and speakers included:

Dr. C. Walter Clarke, New York, executive director, American Social Hygiene Association, Present and Future Public Health Problems in Social Hygiene.

Henry L. McCarthy, Chicago, director, Region No. VI, Social Security Board, Social Protection Program in Action.

Mrs. Bertha Ashby Hess, chief, bureau of health education, Cleveland Health Department, Responsibility of the High Schools in a Social Hygiene Education Program.

Dr. Herman N. Bundesen, president, Chicago Board of Health, Chicago Rapid Treatment Program.

One session was devoted to "Industry versus Venereal Disease."

FOREIGN

Psychiatrist Shot as Hostage.—Dr. Haakon Saethre, director of the psychiatric department of the General Hospital in Oslo, was arrested when at work in the hospital a short time after the police general of the Quisling party of Norway, called the Norwegian Heydrich, was machine gunned to death on the street in Oslo by the Norwegian home forces, February 8. Dr. Saethre was among the prominent members of liberal professions who were arrested and shot or sentenced by the German Standgericht. According to a communication, Dr. Saethre was selected as a victim because he was known for his unhesitating patriotism. The tragedy of Dr. Saethre's death recalls another incident nearly four years ago, the communication stated, when another prominent Norwegian psychiatrist, Dr. Rolf Gjessing, was arrested because he would not accept an inferior Quisling as superintendent of male nurses at his hospital. When Norwegian physicians as a body threatened to strike, the Quislings released Dr. Gjessing.

Deaths in Other Countries

Lord Dawson of Penn, physician to four kings and first Viscount, died March 7 of pneumonia, aged 80. Lord Dawson became physician in ordinary to Edward VII in 1907. He continued in the same post with George V, Edward VII and the present George VI. Although still convalescing from an operation performed a number of months ago he was recently consulted about the health of David Lloyd George, prime minister of Britain in the first world war. He was formerly president of the British Medical Association.

Government Services

Proceedings of Conference on Rheumatic Fever

Proceedings of the national conference on state rheumatic fever programs, held at the Children's Bureau in the fall of 1943, have just been published, and copies are available free on request to the Children's Bureau, U. S. Department of Labor, Washington 25, D. C. The conference, the first of its kind, was called specifically for a pooling of experience in the operation of rheumatic fever control programs by state crippled children's agencies (*THE JOURNAL*, Oct. 30, 1943, p. 578). It was broad in scope, providing an opportunity for a general review of medical, nursing and social problems affecting the rheumatic child. Representatives of many lay and professional groups contributed to the discussion. State rheumatic fever programs are operated by state crippled children's agencies under plans approved by the Children's Bureau and are supported in large part with funds made available under the Social Security Act. The first of these programs was initiated in Oklahoma in 1940. Today state rheumatic fever programs are in effect in nineteen states. Even in these states, however, the problem has scarcely been touched, for services are available in only 239 of the 3,082 counties in the United States and its territories. Only about \$450,000 of federal funds are budgeted for these rheumatic fever programs this fiscal year, a small sum in comparison with the magnitude of the program. The bureau estimates that half a million children in the United States have or are suffering from rheumatic fever.

States Urged to Help in Public Works

Major Gen. Philip B. Fleming, federal works administrator, recently called on the states to assume a greater measure of financial responsibility for the maintenance of schools, hospitals and other public services in war impacted areas. He also directed to their attention the limited amount of Lanham act funds that remain available. In letters to the governors, General Fleming pointed out that many states have treasury surpluses. He also explained that the conditions which made necessary the facilities are likely to persist indefinitely in many areas. The state executives were advised that the Federal Works Agency would cooperate with them and with the local sponsors in working out a program mutually satisfactory and in the best interests of the people as a whole. To date the FWA has allotted \$93,830,767 for maintenance and operation costs of all types of public services, including schools, hospitals, child care and recreation centers and venereal disease rapid treatment hospitals. The allotments for schools totaled \$27,679,799, child care \$42,048,764, venereal hospitals \$12,802,165 and recreation \$6,404,906. Lanham act funds now available do not permit allotments to maintain and operate new facilities except to meet an urgent emergency and are just about sufficient to help keep in operation those already established and still vitally needed. "Federal funds which may be used for these purposes are necessarily limited," General Fleming wrote the governors, "and in view of the fact that many of the states have accumulated treasury surpluses it is my sincere desire that a way may be found whereby the states and their political subdivisions will be able to assume a greater measure of financial responsibility for the maintenance of such facilities, especially since the need is likely to persist in many areas after the authority of the agency to assist is terminated. The wholehearted cooperation which this agency has received from you in the past encourages the hope that together we may arrive at a conclusion mutually satisfactory and in the best interests of the people as a whole." In an earlier letter General Fleming advised the governors of the limited amount of Lanham act funds available for school maintenance and operation. He suggested they recommend increased school appropriations to their legislatures so that the schools might not suffer undue hardship when FWA is forced to reduce, or terminate, contributions. The legislatures in most states convene this year.

The Care of Inert Patients During Transit to Base

The care of inert patients during transit to base is a problem ever present in war. The *Army Medical Department Bulletin* points out that prolonged stay in one position on a stretcher is more than uncomfortable; it may be harmful. Inert patients include those who are unconscious or paralyzed by head or spinal injuries and those who are immobilized as a result of chest or buttock wounds. Pressure sores or massive collapse of the lung are the commonest results of prolonged stay in one position; the latter appears to have a higher incidence in battle accidents than in civilian injuries. A patient who is in good condition when he starts his journey by motor ambulance or air may be found on arrival at the base to have rapid breathing and pulse and signs of a collapsed lung. In chest and buttock wounds the collapse usually occurs on the side opposite to the wound because the patient has been lying on the uninjured side so long. To prevent massive collapse of the lung and pressure sores the following precautions should be taken:

1. Before evacuation inert patients who are conscious should be given breathing exercises at regular intervals. This can be conveniently done when sulfonamide compounds are being administered. Whenever possible, inert patients for evacuation to the base should be prominently labeled. "Unable to move. Please alter position during transit."

2. During transit on a stretcher, whether by motor ambulance or by air, inert patients should have their position altered slightly from time to time. Those who cannot help themselves should be placed in the lowest tier of the stretcher racks of the ambulance or plane. Once every hour the attendant should move the patient by gently lifting his pelvis into a new position. For patients with buttock wounds the lift may have to be applied to the upper part of the trunk, or the patient may be slightly rolled by altering the position of his limbs. Such movements transfer pressure to different areas of the skin and are often followed by alteration of breathing and coughing that clears the respiratory passages of mucus.

Before evacuation of patients who are paraplegic from spinal injury, each pressure point on the lower limbs (heels, malleoli, the head of each fibula) should be protected by large pads of wool and a firm bandage. Where possible an air ring should be provided for protection of the sacrum. Frequent slight alterations of the position of the limbs and trunk are essential; otherwise sloughing bed sores are inevitable. In gunshot wounds of the spine, unlike the fracture-dislocation of civil life, the spinal column is virtually intact and movement of the trunk does not produce further damage to the cord. In paraplegic patients care should be taken to ensure that the suprapubic catheter is not disturbed when the patient is moved.

3. On admission to the receiving hospital the inert patient should be promptly examined and a regimen instituted that ensures frequent change of position. Whenever possible, breathing exercises should be part of the routine.

An Industrial Health Service

A committee of the Royal College of Physicians on social and preventive medicine has presented its report on the reform of industrial medicine. As a large majority of citizens spend a third of their working days in factories, offices and other places of business, the report points out, the importance of an industrial health service is evident. An industrial health ser-

vice should be planned boldly without much regard for traditional arrangements. Factory legislation should be extended to smaller industries and nonindustrial undertakings. The industrial health service should be part of the projected national health service. There should be uniform conditions of service and rates of pay. General administration might be mainly delegated to the Ministry of Labor but in special industries could be carried out by such bodies as the Ministry of Fuel and Power, the Ministry of War Transport or the General Post Office. The service should be national in its scope and apply to every variety of employment.

The service should be staffed by medical inspectors, by consultants in industrial medicine and by whole time and part time medical officers with a nonmedical personnel trained for the type of work undertaken. Clinical facilities, including beds for consultants and research workers in industrial medicine, should be provided. The aims should be promotion of the general health of the worker by providing the optimum environmental conditions, by preventing disease and accidents in industry, by taking an appropriate share in rehabilitating the disabled and by educating the workers in preserving health and well being. Research in industrial health should be given every possible encouragement. As the service is comprehensive and national in scope, the family doctor has a vital part to play in it as a part time industrial officer. He should be trained for this function.

Fitting the individual worker for his job will entail inquiry into his physical and mental capacity. The doctor's share in selection and allocation is not restricted to those entering industry but is equally necessary when workers change their occupation, perhaps because of illness. As to rehabilitation, efficient facilities for it require the closest ties between the national health and the industrial service. The final stages of restoration should be carried out at the place of work. For those who wish to take up industrial health as a career, training should be provided based on a broad study of preventive and social medicine in order to avoid too narrow specialization. A special course of instruction in industrial health should be preceded by at least two years of postgraduate experience in medicine, of which not less than one year should be spent in general practice. Whether a special diploma in industrial health is instituted or not there should be a well designed course of training of one year's duration. As to research work, up to the war the Industrial Health Research Board carried out pioneer work which promised great benefits to industrial organizations. After the war there will be increasing need for research in both field and laboratory. At present teaching schools are considering the creation of departments and chairs in industrial health.

British Medical Officer Honored by President Roosevelt

As chief surgeon of the allied forces Major General Sir Ernest Marshall Cowell planned and executed the medical services for the allied landings and subsequent operations in North Africa, Sicily and Italy. For exceptionally meritorious conduct in the performance of outstanding services from September 1942 to March 1944 as director of medical services, Allied Headquarters, Mediterranean Theater, he was decorated with the Legion of Merit by General Eisenhower, Allied Supreme Commander. The decoration was awarded by President Roosevelt. According to the citation, "by personal supervision and inspection of the forward areas, and by effecting new techniques whenever necessary to meet the constantly changing situation, he welded together medical services of the American and British forces and produced a highly successful organization, which resulted in the saving of many lives and contributed to the well being and comfort of the sick and wounded of both nations."

JERUSALEM, Feb. 2, 1945.

Endocrine Allergy

In a lecture held at the Jewish Medical Association in Jerusalem, Zondek and Bromberg submitted the results their research in the field of endocrine allergy had yielded during recent years. It is generally accepted that allergic manifestations are elicited by exogenic allergens. But there are evidences that allergic reactions may also occur following the action of endogenous allergens produced within the organism by endocrine glands. Certain pathologic disturbances are due to this peculiar reactivity of the organism to the action of its hormones and of the products of their metabolism. The name of "endocrine allergy" has been proposed for these conditions. It has been shown that this kind of allergic reactions may arise not only following the action of endogenous glandular secretions of protein nature as thyroxin, insulin and chorionic gonadotropin but also as the result of allergenic activity of steroid hormones (estradiol, progesterone, testosterone, desoxycorticosterone) and their products of metabolism (estrone, pregnandiol, androstosterone). The following clinical observations point to the existence of endocrine allergy:

(a) In certain cases injections of estrone, estradiol benzoate or other steroid hormones induce general symptoms, such as nausea, vomiting, fever, diarrhea and urticaria.

(b) Certain allergic diseases (asthma, angioneurotic edema, urticaria, migraine) take sometimes a particularly severe form during the premenstrual phase in which production of the follicle and corpus luteum hormones reach maximal levels.

(c) In some cases of pruritus vulvae, administration of estrogenic substance gives relief only if given in low dosage; large doses may cause severe exacerbation of the disease. The successful treatment of pruritus vulvae by percutaneous application of small quantities of sex hormones (Zondek) is plausibly explained as a consequence of desensitization through continuous absorption of hormone in regular doses.

In an investigation made on a series of 32 healthy, regularly menstruating women and 150 patients complaining of various disorders suspected of being conditioned by endocrine allergy, numerous facts supporting the hypothesis of sensitivity to endogenous secretions have been established. The latter may be thus summarized:

1. The skin reagins to the steroid hormones have been demonstrated by the specific positive reaction which appears twenty-four to forty-eight hours after intracutaneous injection of a minimal quantity of hormone; analogous conditions of sensitivity to protein and insulin may occur. The positive skin reactions to hormones have been observed in women suffering from various disorders related to menstruation or the menopause but never in healthy subjects.

2. In patients sensitive to steroid hormone it is possible to reactivate the formerly positive skin reaction by subcutaneous injection of the hormone in question in another site ("recurrent reaction").

3. In some patients in whom the allergic symptoms appear in the premenstruum, the positive cutaneous reaction may recur for several months in the premenstrual period. This "retarded reaction," which appears at the same time coincident with the attainment of a maximum level in the body by the allergenic hormone, is further proof of the existence of endocrine allergy.

4. The passive transfer test (positive Prausnitz-Kuestner test) has been obtained on many occasions with serum of patients sensitive to hormones; this observation points to the presence of allergic antibodies circulating in the blood of these patients.

5. Injections of minimal quantities of glandular products into persons who have not previously received endocrine treatment may cause serious general symptoms.

6. Personal and family histories of allergy and high blood eosinophilia are frequent in persons with positive cutaneous tests.

7. Specific desensitization by injections of gradually increasing doses of allergenic hormone gave favorable clinical results in various disturbances related to the menstrual cycle or the menopause; it is a proof that the disturbances in question have been caused by endocrine allergy.

The results of this investigation lead to the assumption that in patients showing allergic manifestations attention should be paid not only to the exogenic allergens but also to the possibility of sensitivity to endogenous hormones. These facts should be kept in mind in the study of various clinical pictures and their differential diagnosis. It has been shown that certain disturbances related to the menstrual cycle, as premenstrual tension, migraine, urticaria, pruritus vulvae, premenstrual fever and certain ocular manifestations (superficial keratitis), often result from allergy to endogenous hormones. On the other hand, various complaints appearing at the menopause as migraine and pruritus vulvae may also be due to endocrine allergy. Certain cases of asthma, vasomotor rhinitis and angioneurotic edema presenting a particularly severe course during the premenstrual phase or the menopause may also be caused by this peculiar kind of allergic sensitivity. The fact that the organism may react allergically to secretions of its own endocrine glands throws a new light on the study of allergy.

Marriages

GEORGE ALFRED HIGGINS JR., Albuquerque, N. M., to Miss Isabelle Jeannette Heck of Chicago in Rochester, Minn., January 23.

RICHARD CAMPBELL CLAY, Birmingham, Ala., to Miss Madeline Murray of Whalesville, Md., in Baltimore, December 30.

GRANVILLE ALLEN LAWRENCE JR., Philadelphia, to Miss Rebecca Belle Patterson of Hollidaysburg, Pa., November 17.

ANTHONY M. KURLAND, Denver, to Miss Lucille Elizabeth Theraux of Philadelphia in Fairfield, Ohio, December 1.

WILLIAM NYE CORPENING, Houston, Texas, to Miss Avis Simons Kiser, formerly of Laurens, S. C., December 23.

HENRY BERNARD STRYKER JR., Englewood, N. J., to Miss Carolyn Roberta Guy of Glens Falls, N. Y., December 2.

GUS EVANS FORBES JR., Greenville, N. C., to Miss Nancy Burnette Armistead of South Hill, Va., November 25.

JOHN DAVID FOLSOM to Miss Ruth Corinne Ludwick, both of Lincoln, Neb., in Staten Island, N. Y., January 20.

WALTER MACINTIRE WHITEHOUSE, Ypsilanti, Mich., to Miss Barbara Norton McIntyre of Grand Rapids recently.

KEARNS REID THOMPSON JR., Durham, N. C., to Miss Sara Elizabeth Bell of Dillon, S. C., December 30.

ARTHUR RHETT GUNTER, Rock Hill, S. C., to Miss Emily Sims Jennings of Spartanburg, December 16.

CHARLES ROBERT WATSON to Miss Pauline Lindsey Davis, both of Little Rock, Ark., December 26.

JOHN W. DONNELL, Hudson, Iowa, to Mrs. Ruth Lowell of Fort Lauderdale, Fla., October 1.

RAYMOND ROBERT SUSKIND to Miss Ida Blanche Richardson, both of New York, December 27.

SAMUEL C. MURPHY to Miss Hazel Jamison Melick, both of Warsaw, Ind., January 9.

HUGO J. EHRENFELD to Miss Eve Emerson Pauker, both of New York, January 27.

HAROLD M. GOODMAN to Miss Harriett Lewis, both of Richmond, Va., December 3.

THOMAS V. BANKS to Miss Jean Sorrell, both of Dyersburg, Tenn., January 7.

Deaths

Sara Josephine Baker ☉ Bellemead, N. J.; Woman's Medical College of the New York Infirmary for Women and Children, New York, 1898; in 1901 joined the New York City Department of Health as a school medical inspector; six years later appointed assistant to the health commissioner, serving until 1908, when she became director of the newly organized bureau of child hygiene of the New York City Department of Health, which was the first of its kind under governmental control and which was eventually copied by some thirty-five states; resigned from that position in 1923; for many years lecturer on child hygiene at Columbia and New York universities; formerly consultant in child hygiene to the U. S. Public Health Service and a member of the Health Committee of the League of Nations; consultant to the Children's Bureau, U. S. Department of Labor; member of the New Jersey State Board of Health; member of the medical board of the Maternity Center Association, New York City; member of the board and consulting pediatrician to the Clinton (N. J.) Reformatory for Women; fellow of the New York Academy of Medicine and the American Public Health Association; member of the Medical Society of the State of New York; honorary member of the Medical Society of the State of New Jersey and the Somerset County Medical Society; associate member of the American Academy of Pediatrics; member and past president of the Medical Women's National Association; past president of the American Child Hygiene Association; honorary president of the Children's Welfare Federation of New York City; member of the board of trustees of the New York Infirmary for Women and Children; in 1917 received the degree of doctor of public health from the Bellevue Hospital Medical College, New York; lectured extensively in this country and in Europe; in the years 1939 and 1940, the American Woman's Suffrage Association and the General Federation of Women's Clubs (in connection with their fiftieth anniversaries) and the Congress of Women of the World's Fair bestowed on her recognition of her achievement in the field of public health as one of the outstanding fifty women of this country; author of "Healthy Mothers," "Healthy Babies," "Healthy Children," "Child Hygiene" and an autobiography, "Fighting for Life"; died in New York Hospital February 22, aged 71.

Ellice Murdoch Alger ☉ New York; University of Vermont College of Medicine, Burlington, 1893; specialist certified by the American Board of Ophthalmology; for many years professor of ophthalmology and clinical ophthalmology at the New York Post-Graduate Medical School, Columbia University, and surgeon at its hospital; at one time taught at his alma mater; one of the founders in 1915 of the National Society for the Prevention of Blindness, serving continuously on its board of directors until his death; at one time a member of the subcommittee for the prevention of blindness organized by the New York Association for the Blind; in 1938 the Association for Research in Ophthalmology, of which he was a member, in cooperation with the St. Louis Society for the Blind, awarded him the Leslie Dana Gold Medal for "outstanding achievements in the prevention of blindness and the conservation of vision"; member of the American Ophthalmological Society and the New York Ophthalmological Society, of which he was past president; served as chairman of the section of ophthalmology of the New York Academy of Medicine; fellow of the American College of Surgeons; author of "Refraction and Motility of Eye"; died in the New York Post-Graduate Hospital February 18, aged 74.

Byron McBride Caples ☉ Waukesha, Wis.; Willamette University Medical Department, Salem, 1889; Rush Medical College, Chicago, 1891; member of the House of Delegates of the American Medical Association in 1905, 1906, 1907, 1908 and 1911; past president of the State Medical Society of Wisconsin; twice president of the Waukesha County Medical Society and in 1943, in recognition of his completion of fifty years in the practice of medicine, awarded honorary life membership in the society; in 1924 president of the Milwaukee Neuro-Psychiatric Society; member of the American Psychiatric Association, Milwaukee Academy of Medicine, Medical Veterans of the World War, National Geographic Society and State Historical Society of Wisconsin as well as the Waukesha Chamber of Commerce; during World War I served as chairman of the medical advisory board of Waukesha County, also serving on the Waukesha council of defense and as psycho-neurologist on the draft board; in 1898 established the Waukesha Springs Sanitarium and operated it until 1943, when the largest building on the property was sold to Carroll College, named Caples Hall in his honor; died in the Waukesha Memorial Hospital January 18, aged 84.

Robert Ratze Brown ☉ Nashville, Tenn.; Vanderbilt University School of Medicine, Nashville, 1914; assistant professor of clinical orthopedic surgery at his alma mater; a member of the board of directors and past president of the Nashville Academy of Medicine; past president of the Davidson County Medical Society; member of the American Proctologic Society, Clinical Orthopedic Society, Southern Medical Association and the American Academy of Orthopaedic Surgeons; specialist certified by the American Board of Orthopaedic Surgery; a captain with the Vanderbilt medical unit attached to the First Division during World War I; on the staffs of the Vanderbilt, St. Thomas, Protestant and Nashville General hospitals; member of the Tennessee State Crippled Children Commission and had been active in the medical work of the Junior League Home for Crippled Children for many years; died February 6, aged 54, of coronary thrombosis.

Shenton Stanley King ☉ New Rochelle, N. Y.; McGill University Faculty of Medicine, Montreal, Que., Canada, 1905; member of the American Psychiatric Association and the American Orthopsychiatric Association; fellow of the Royal Institute of Public Health, London; received many decorations for his services during World War I; since 1933 a member of the bureau of child guidance, department of family and child welfare of Westchester County; served on the staff of the Grasslands Hospital, Valhalla; received the doctor of public health degree from Johns Hopkins University School of Hygiene and Public Health in Baltimore in 1924; died in the New Rochelle Hospital January 4, aged 66, of cerebral hemorrhage.

James Harold Mathews ☉ Seattle; University of Michigan Medical School, Ann Arbor, 1922; president-elect of the King County Medical Society; formerly instructor of otolaryngology at his alma mater; specialist certified by the American Board of Otolaryngology; member of the Pacific Coast Oto-Ophthalmological Society; served as president of the Puget Sound Eye and Ear Society; interned at the Harper Hospital in Detroit; president of the Seattle Eye, Ear, Nose and Throat Infirmary; on the attending staff of the Swedish Hospital; consultant on the staffs of the Children's Orthopedic Hospital and the Providence Hospital, where he died January 30, aged 49, of heart block during cholecystectomy and aortic insufficiency.

William Harry Barnes ☉ Philadelphia; University of Pennsylvania School of Medicine, Philadelphia, 1912; specialist certified by the American Board of Otolaryngology; served as lecturer on bronchoscopy at Howard University and consulting bronchoscopist at Freedmen's Hospital, both in Washington, D. C.; assistant surgeon in the U. S. Public Health Service during World War I; member and assistant treasurer of the Philadelphia Housing Authority; on the staffs of the Jefferson Hospital and the Mercy Hospital, where he died January 15, aged 57, of transverse lesion of the cord incurred from an injury.

Anthony Barone, Boston; Middlesex College of Medicine and Surgery, Cambridge, 1921; member of the American Medical Association; also a dentist and pharmacist; died December 8, aged 48, of bronchopneumonia.

Frank Burr Combs, Chicago; Northwestern University Medical School, Chicago, 1905; member of the American Medical Association; died in the Albert Merritt Billings Hospital January 20, aged 65, of coronary thrombosis.

Charles H. Donoho, Portland, Tenn.; University of Nashville Medical Department, 1899; member of the American Medical Association; died in St. Thomas Hospital, Nashville, December 2, aged 71.

Albert George Kreimer, Cincinnati; University of Cincinnati College of Medicine, 1922; member of the American Medical Association; died in the Mercy Hospital December 22, aged 50.

William John Reed, Peoria, Ill.; University of Illinois College of Medicine, Chicago, 1934; died in Los Angeles December 9, aged 35.

Eugene Clyde Underwood Jr., Louisville, Ky.; Hospital College of Medicine, Louisville, 1904; examiner for the Reynolds Research Corporation; served on the staff of SS Mary and Elizabeth Hospital, where he died December 30, aged 62, of coronary thrombosis.

William R. Washburn, Fort Bayard, N. M.; St. Louis University School of Medicine, 1904; member of the American Medical Association; served during World War I; served on the staff of the Veterans Administration Facility, where he died December 28, aged 68, of coronary arteriosclerotic heart disease.

Frank W. Watson, Union City, Tenn.; Missouri Medical College, St. Louis, 1885; past president and secretary of the Obion County Medical Society; served on the school board; died in the Union City Clinic January 2, aged 81, of pneumonia.

DIED WHILE IN MILITARY SERVICE

Patrick Sarsfield Haran, Brooklyn; Long Island College Hospital, Brooklyn, 1923; member of the American Medical Association; served on the staffs of the Kings County, Holy Family and Midwood hospitals; commissioned a captain in the medical corps, Army of the United States, on Aug. 18, 1942; died in the Regional Hospital, Fort Jay, N. Y., Dec. 15, 1944, aged 46, of epidemic infectious hepatitis and bronchopneumonia.

Edward Thorne Harrison, High Point, N. C.; University of Virginia Department of Medicine, Charlottesville, 1926; fellow of the American College of Surgeons; member of the American Medical Association; interned at the Battle Creek Hospital, Battle Creek, Iowa, Jamaica Hospital, Richmond Hill, N. Y., Chesapeake and Ohio Railway Hospital, Clifton Forge, Va., and the Willard Parker Hospital in New York; member of the surgical staff of the Burrus Memorial Hospital; commissioned a major in the medical corps, Army of the United States, on July 18, 1942; died in the Moore General Hospital, Swannanoa, Dec. 18, 1944, aged 46, of aplastic anemia.

John Milton Hill @ Pittsburgh; University of Pittsburgh School of Medicine, 1932; specialist certified by the American Board of Radiology, Inc.; member of the Radiological Society of North America, Inc., and the American College of Radiology; served on the staffs of the Passavant, St. John's General, Presbyterian and Woman's hospitals; assistant radiologist at the Falk Clinic; commissioned a major in the medical reserve corps of the U. S. Army on April 13, 1942; began active duty on July 15, 1942; stationed at Fort Lewis, Wash., with the Pitt Medical Unit until December 1943, when he was sent to Australia with Base Hospital unit number 27; promoted to lieutenant colonel; died in the Walter Reed General Hospital, Washington, D. C., November 13, aged 46, following an operation for brain tumor.

George Forster Hilles, Cleveland Heights, Ohio; Western Reserve University School of Medicine, Cleveland, 1939; interned at St. Vincent Charity Hospital and served a residency in medicine at the Evangelical Deaconess Hospital in Cleveland; commissioned a lieutenant in the medical reserve corps of the U. S. Army, June 14, 1939; began active duty in the Army of the United States on May 5, 1941; later promoted to captain; after serving nineteen months in Panama, returned to the United States in April 1943; subsequently went to North Africa and Italy, where he was killed in an airplane accident Aug. 23, 1944, aged 30.

James Willard McMurray, Williston, Fla.; Tulane University of Louisiana School of Medicine, New Orleans, 1934; member of the American Medical Association; health officer of Gilchrist-Levy Counties Health Department; formerly district health officer of West Florida with headquarters at Marianna, director of the Broward County Health unit with headquarters at Fort Lauderdale, and the Gulf-Calhoun-Franklin unit with headquarters at Apalachicola; commissioned a first lieutenant, medical corps, Army of the United States, on March 3, 1944; died in the Billings General Hospital, Fort Benjamin Harrison, Ind., Dec. 14, 1944, aged 38, of coronary occlusion.

Oscar Frederick Nolan @ San Francisco; Baylor University College of Medicine, Dallas, 1927; specialist certified by the American Board of Urology, Inc.; member of the Pacific Association of Railway Surgeons and the Western Branch of the American Urological Association; urologist for the Southern Pacific Hospital and St. Francis Hospital; consulting urologist at the French Hospital; commissioned a first lieutenant in the medical reserve corps of the U. S. Army on May 30, 1927; began active duty as a captain in the Army of the United States on July 27, 1941, stationed at the Letterman General Hospital, where he was chief of the urologic service; later promoted to major and lieutenant colonel; accidentally drowned in the Abbotts Lagoon, Marin County, while duck hunting, Nov. 12, 1944, aged 44.

Joe Holmes Price, Poplarville, Miss.; University of Oklahoma School of Medicine, Oklahoma City, 1928; served during World War I; formerly on the staffs of

various Veterans Administration facilities; at one time state district health superintendent at McLeansboro, Ill.; commissioned a first lieutenant in the medical reserve corps of the U. S. Army on Feb. 12, 1930; began active duty as a captain in the Army of the United States on July 22, 1942; died 5 miles East of Baton Rouge, La., Dec. 4, 1944, aged 46, of injuries received in an automobile accident.

Raphael Raymond Sprafka @ Chicago; Northwestern University Medical School, Chicago, 1937; interned at the Hospital of St. Anthony de Padua; diplomate of the National Board of Medical Examiners; commissioned a first lieutenant in the medical corps, Army of the United States, on Aug. 3, 1942; promoted to captain on Oct. 5, 1943; died in Beauvais Tille, France, Dec. 4, 1944, aged 33, of multiple fractures incurred in an airplane crash.

Judson Ludwell Taylor @ Commander (MC), U. S. Navy, retired, Houston, Texas; University of Texas School of Medicine, Galveston, 1903; professor and chairman of the department of surgery at Baylor University College of Medicine; served as professor of general and oral surgery at the Texas Dental College from 1931 to 1943, when he became supervisor of hospital instruction at the University of Texas School of Dentistry, from which position he resigned to accept an appointment by the governor of Texas to the board of regents of the University of Texas, Nov. 15, 1944; served as lecturer in surgery at his alma mater; president of the State Medical Association of Texas, 1942-1943, and councilor of the Ninth District from 1939 to 1941; president of the Harris County Medical Society in 1934; founder member of the American Board of Surgery; member of the Texas Surgical Society, American Association for the Surgery of Trauma, Association of Military Surgeons of the United States, History of Science Society and the Southern Medical Association; fellow of the American College of Surgeons; served as trustee of the Houston Academy of Medicine; chief surgeon at the Southern Pacific Hospital; consulting surgeon, Jefferson Davis, Memorial and the Methodist hospitals; surgeon in chief, Hermann Hospital; appointed chief of staff of the Arabia Temple's Crippled Children's Hospital in 1922, becoming chief of staff emeritus in 1930; recently surgeon to the M. D. Anderson Hospital for Cancer Research, president of the Maternal Health Center from 1936 to 1943, medical director of the Birth Control League of Texas from 1938 to 1941 and the Texas League for Planned Parenthood from 1941 to 1943; a member of the executive committee, Harris County chapter, National Foundation for Infantile Paralysis, since 1943; served as member of the board of directors of the Union National Bank; appointed assistant surgeon in the U. S. Navy on Jan. 17, 1904 and retired on Feb. 19, 1912 for incapacity resulting from an incident of service; awarded the Victory Medal for his services during World War I, for which he had been recalled to active duty as a lieutenant commander in the U. S. Navy; in June 1942 recalled to active duty with rank of lieutenant commander; on Sept. 22, 1943 was given a spot promotion to the rank of commander, medical corps, U. S. Navy, retired, the rank held at the time of his death; senior medical officer in the office of naval officer procurement; died Nov. 28, 1944, aged 63, of coronary occlusion.

Charles Edward Walker Jr., Denver; Harvard Medical School, Boston, 1932; member of the American Medical Association; interned at St. Luke's Hospital, Denver; served a residency in ophthalmology at the Massachusetts Eye and Ear Infirmary, Boston; member of the American Academy of Ophthalmology and Oto-Laryngology; fellow of the American College of Surgeons; specialist certified by the American Board of Ophthalmology; formerly instructor in ophthalmology at the University of Colorado School of Medicine; served on the staffs of St. Luke's, Colorado General, Denver General, St. Joseph's and Presbyterian hospitals; commissioned a first lieutenant in the medical reserve corps of the U. S. Army on June 23, 1932; began active duty as a captain on Feb. 6, 1941; later promoted to major and lieutenant colonel; died in Paris, France, Nov. 22, 1944, aged 41, of coronary occlusion.

Correspondence

WILL PENICILLIN BE USED INDISCRIMINATELY?

To the Editor:—Penicillin will soon be available for general civilian use. It is understood that commercial firms will soon have sufficient supplies to market it through their usual channels and that it will soon reach the local drugstore. There it will almost certainly be available to the general practitioner on much the same basis as any other biologic product. While still expensive, its price will not be prohibitive. Its use will in all likelihood be widespread, both because of its remarkable efficacy and because of the magic of its name to doctor and public alike. Further, the recent announcement by Libby (*Science*, February 16) that penicillin in cottonseed oil solution enclosed in gelatin capsules has been satisfactorily administered by mouth to human beings appears to herald even more extensive use of penicillin and its related compounds.

It would seem that now is the time to take proper safeguards against their indiscriminate use. The proper patterns, set now, might well avoid the tragedies that accompanied the introduction of the sulfonamide drugs and the waste that accompanied the introduction of purified vitamin preparations.

Time alone will tell what the abuses of penicillin are to be. Its parenteral administration has resulted in an infrequent but definite number of reactions such as urticaria (see Report of the Committee on Chemotherapeutic and Other Agents of the National Research Council in *THE JOURNAL*, Aug. 28, 1943, page 1217, and other reports), thrombophlebitis and even contact dermatitis (Pyle, H. D., and Ratner, Herbert, *ibid.*, July 29, 1944, p. 903). Penicillin may be harmful in acute rheumatic fever (Foster, F. P., and others, Sept. 30, 1944, p. 281) and penicillin resistant strains may develop (Virulence of Penicillin Resistant Bacteria, editorial, Aug. 12, 1944, p. 1042). It is not yet fully known how many of the reactions described were due to impurities in the penicillin preparations then in use, nor is there much information about the toxic reactions, or their lack of them, with penicillin taken by mouth in a vehicle suitable for its ultimate absorption. Penicillin so far appears to be a far safer drug than the sulfonamides, and its indiscriminate use might actually be accompanied by fewer reactions than with the current widespread consumption of aspirin or by less economic waste than now accompanies the indiscriminate use of purified vitamins.

Perhaps the greatest danger of the indiscriminate use of penicillin is of another sort, namely the development of a sense of false security. Penicillin is of no use in many diseases, and in others there is danger from inadequate dosage. For example, it is not hard to visualize that a patient with a chancre would hear that penicillin cures syphilis, would get hold of some, take it (or have it administered) in inadequate dosage, see his chancre disappear, feel that he has been cured of the disease, and then develop cerebrospinal or cardiovascular syphilis many years hence. Numerous other examples can be imagined, and some have probably already occurred.

Nor does it appear unlikely that a period of commercial exploitation of penicillin will soon set in. It is not at all unlikely that the "patent medicine" manufacturers will soon get hold of the drug and we may soon have intense salesmanship of penicillin chewing gum, penicillin cough drops and penicillin mouth wash, not to mention penicillin skin cream or even penicillin laxatives. Perhaps such mild unleashings of the imagination will prove to be too conservative.

It is certainly too early to know yet just how the matter will develop. It would appear to be none too early, however, to reassure ourselves of at least the following:

1. That adequate research will be undertaken, and maintained, to ascertain the best forms of penicillin and related compounds for therapeutic use, their indications and contraindications, their best routes of administration and their toxic reactions, both direct and indirect.
2. That adequate education of the doctor, the druggist and the public will be carried on to assure the proper use (and restraint from use) of penicillin.
3. That proper steps will be taken by professional organizations, particularly the medical and pharmaceutical associations, to prevent possible abuses of penicillin and to assure its availability where needed.
4. That the drug industry will take the necessary steps to foresee and prevent, mainly through voluntary discipline, possible abuses and maldistribution.
5. That the government will not relax its controls until there is evidence that to do so would not lead to shortages in cases in which penicillin is necessary or, contrarilywise, to a riot of commercialized penicillinization of our population.

Some of the points of view in this communication may be mistaken, especially since I am no longer intimately associated with work on penicillin (my former contact was outlined in a previous communication in *THE JOURNAL*, April 22, 1944, p. 1219). There are quite clearly dangers from the failure to use penicillin in disease which it alone will cure. There are also dangers of too stringent controls on its use. These are not discussed here, since the opposite factors appear to need more emphasis now. It would appear that full discussion of this question, perhaps mainly in the columns of *THE JOURNAL*, would be of considerable importance in avoiding mistakes which might prove tragic as penicillin becomes more readily available. Penicillin has got off to a good start under the guidance of the O. S. R. D., the National Research Council and the W. P. B. It would be sad if its future was less wholesome.

LESLIE A. FALK, 1st Lieutenant, M. C., A. U. S.

To the Editor:—The public press announces a wide range of applications of penicillin in preparation for release to laymen after March 15. Penicillin lozenges, chewing gum and dental paste are listed with penicillin vaginal jelly. Further, it is stated that cosmetic manufacturers are studying penicillin with an eye toward including penicillin in face creams, shaving pastes and lotions and similar products.

What measures, if any, have been taken to control the self administration of penicillin in the vehicles listed? Has any official representation been made to the Food, Drug and Cosmetic Administration regarding need for regulation? Has any state or municipality amended its sanitary code or pharmacy laws to include penicillin? Has any official educational effort been initiated to apprise the potential customers of penicillin toothpaste, penicillin dental cream or penicillin chewing gum regarding the effective time-dose factors for effective utilization of the drug? Inadequate dosage is now known to mask the symptoms of syphilis when administered for gonorrhea. It is not too much to expect that partial indiscriminate dosage of penicillin through self administration by throat lozenges, chewing gum, shaving cream and vaginal jellies will produce other examples to the detriment of the sick and the formation of a large army of infection carriers.

The time is now to make the proper moves—now while penicillin is still restricted in distribution.

HERMAN GOODMAN, M.D., New York.

SULFADIAZINE IN PREVENTION
OF MENINGITIS

To the Editor:—It may be of interest, particularly to physicians in mental hospitals, to be informed of a situation which developed at this institution, and the procedure adopted.

On Nov. 12, 1944 a man aged 33 whose mental diagnosis was psychosis with organic changes of the central nervous system, paralysis agitans, was given a clinical diagnosis of cerebrospinal meningococcic meningitis, which was directly confirmed by laboratory examinations. Penicillin was given intrathecally, with definite improvement manifest the following day, and he made a prompt and uncomplicated recovery, receiving two subsequent doses of penicillin.

The point of interest is this: The patient was located in a very crowded ward. It seemed inevitable that many of the 400 patients and personnel in this ward had been exposed. Following the technic described in an article by Lieut. Col. Joseph F. Painton, M. C., U. S. Army, published in the October 1944 issue of the *Military Surgeon* on page 267, all 400 received 2 Gm. of sulfadiazine by mouth, followed in six hours by a second dose of 2 Gm. and a third dose of 1 Gm. given twelve hours after the second dose. No further cases developed, and no ill effects were observed from these prophylactic doses.

The apparent results of this procedure would appear to be significant and worth trying in institutions where overcrowding is as serious as it is in many instances today.

CHARLES A. ZELLER, M.D., Philadelphia.

Superintendent, Philadelphia State Hospital.

TREATMENT OF HYPERTHYROIDISM
WITH THIOURACIL

To the Editor:—In a recent editorial (THE JOURNAL, February 10, p. 334) commenting on British experience in the treatment of hyperthyroidism with thiouracil as reported by Nussey in the *British Medical Journal*, Dec. 9, 1944, it is remarked that this author has apparently presented a safe basis for continued administration of thiouracil. It is suggested that 0.6 Gm. daily of thiouracil be administered daily for three to five weeks with gradual reduction thereafter to the minimal effective dose. Adequate supervision of the patient is urged without definition of this phrase. No mention is made of any toxic reactions.

Analysis of Nussey's article shows that there were 27 patients treated for periods varying from three weeks to twelve months with dosages ranging from 0.05 to 0.6 Gm. daily. Observations included leukocyte counts at intervals of one to several months. Among the 27 patients there were 4 with skin eruptions. Seven of the 27 patients exhibited either neutropenia or leukopenia during treatment. It is significant that many of the low counts occurred after the basal metabolic rate had become normal. The author himself notes that "consistently low figures were seen" in 2 cases. No serious neutropenic reactions occurred in this series, but in almost all published series at least one severe neutropenic or agranulocytic reaction has been observed, occasionally with fatality. Our own experience with the use of thiouracil in the treatment of toxic goiter has confirmed these findings. Those who employ thiouracil should "adequately supervise" its administration by performing leukocyte counts at least three times weekly, with differential counts whenever the total count drops below 5,000 per cubic millimeter. In addition, our experience, as well as that of others, has demonstrated the importance of frequent clinical observation with respect to skin eruptions, pharyngitis, fever and jaundice. Moreover, there is considerable evidence that the dosage-time factor is not of determining significance in the development of toxic reactions to the drug.

SAMUEL L. GARGILL, M.D.

MARK FALCON LESSES, M.D.

Boston.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS
EXAMINING BOARDS IN SPECIALTIES

Examinations of the National Board of Medical Examiners and Examining Boards in Specialties were published in THE JOURNAL, March 10, page 614.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: Montgomery, June 26-28. Sec., Dr. B. F. Austin, 519 Dexter Ave., Montgomery 4.

ALASKA: Juneau, March. Sec., Dr. W. M. Whitehead, Box 561, Juneau.

ARIZONA: * Phoenix, April 3-4. Sec., Dr. J. H. Patterson, 826 Security Bldg., Phoenix.

ARKANSAS: * Eclectic, Little Rock, June 7. Sec., Dr. C. H. Young, 1415 Main St., Little Rock. Medical, Little Rock, June 7-8. Sec., Dr. D. L. Owens, 701 Main St., Little Rock.

CALIFORNIA: Oral, San Francisco, May 20. W'ritten, San Francisco, July 9-12. Sec., Dr. Frederick N. Scatena, 1020 N St., Sacramento 14.

COLORADO: * Denver, April 3-6. Final date for filing application is March 19. Sec., Dr. J. B. Davis, 831 Republic Bldg., Denver.

CONNECTICUT: * Endorsement, March 27. Sec., to the Board, Dr. Creighton Barker, 258 Church St., New Haven.

DELAWARE: Examination, Dover, July 10-12. Reciprocity, Dover, July 17. Sec., Medical Council of Delaware, Dr. J. S. McDaniel, 239 S. State St., Dover.

FLORIDA: * Jacksonville, June 25-26. Sec., Dr. Harold D. Van Schaick, 2736 S. W. Seventh Ave., Miami 36.

IDAHO: Boise, July 10. Dir., Bureau of Occupational Licenses, Miss Agnes Barnhart, 355 State Capitol Bldg., Boise.

ILLINOIS: Chicago, April 3-5. Superintendent of Registration, Department of Registration and Education, Mr. Philip Harman, Springfield.

INDIANA: Indianapolis, Aug. 28-30. Sec., Board of Medical Registration & Examination, Dr. W. C. Moore, 301 State House, Indianapolis 4.

KENTUCKY: Louisville, June 18-20. Sec., State Board of Health, Dr. Philip E. Blackerby, 620 S. Third St., Louisville 2.

MARYLAND: Medical, Baltimore, June 19-20. Sec., Dr. J. T. O'Mara, 1215 Cathedral St., Baltimore. Homoeopathic, Baltimore, June 19-20. Sec., Dr. J. A. Evans, 612 W. 40th St., Baltimore.

MINNESOTA: * Minneapolis, April 17-19. Sec., Dr. J. F. DuBois, 230 Lowry Medical Arts Bldg., St. Paul 2.

MONTANA: Helena, April 2-4. Sec., Dr. O. G. Klein, First Nat'l Bank Bldg., Helena.

NEW JERSEY: Trenton, June 19-20. Sec., Dr. E. S. Hallinger, 28 W. State St., Trenton.

NEW MEXICO: * Santa Fe, April 9-10. Sec., Dr. LeGrand Ward, 141 Palace Ave., Santa Fe.

NORTH DAKOTA: Grand Forks, July 3. Sec., Dr. G. M. Williamson, 4½ S. Third St., Grand Forks.

OHIO: Endorsement, Columbus, April. Columbus, June. Sec., Dr. H. M. Platter, 21 W. Broad St., Columbus.

OKLAHOMA: * Oklahoma City, June 14-16. Sec., Dr. J. D. Osborn, Jr., Frederick.

PENNSYLVANIA: April 10-13. Act. Sec., Bureau of Professional Licensing, Department of Public Instruction, Mrs. M. G. Steiner, 358 Education Bldg., Harrisburg.

RHODE ISLAND: * Providence, April 5-6. Chief, Division of Examiners, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH CAROLINA: Columbia, June 25-27. Sec., Dr. N. B. Heyward, 1329 Blandina St., Columbia.

SOUTH DAKOTA: * Pierre, July 17-18. Sec., Medical Licensure, State Board of Health, Dr. Gilbert Cottam, State Capitol, Pierre.

TEXAS: Galveston, June 4-6. Sec., Dr. T. J. Crowe, 918-20 Texas Bank Bldg., Dallas 2.

VERMONT: Burlington, June. Sec., Dr. F. J. Lawless, Richford.

VIRGINIA: * Richmond, June 20-23. Sec., Dr. J. W. Preston, 30½ Franklin Rd., Roanoke.

WASHINGTON: * Seattle, July 16-18. Sec., Department of Licenses, Miss Nell Adams, Olympia.

WISCONSIN: * Milwaukee, June 26-28. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

CONNECTICUT: June 9. Address State Board of Healing Arts, 250 Church St., New Haven 10.

DISTRICT OF COLUMBIA: Washington, April 23-24. Sec., Commission on Licensure, Dr. G. C. Rubland, 6150 E. Municipal Bldg., Washington 1.

FLORIDA: DeLand, June 1. Final date for filing application is May 17. Sec., Dr. J. F. Conn, John B. Stetson University, DeLand.

IOWA: Des Moines, April 10. Dir., Division of Licensure and Registration, Mr. H. W. Grefe, Capitol Bldg., Des Moines.

MICHIGAN: Ann Arbor and Detroit, May 11-12. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing.

MINNESOTA: Minneapolis, April 3-4. Sec., Dr. J. C. McKinley, 126 Millard Hall, University of Minnesota, Minneapolis 14.

NEBRASKA: Omaha, May 1-2. Dir., Bureau of Examining Boards, Mr. Oscar F. Humble, 1009 State Capitol Bldg., Lincoln.

OKLAHOMA: Oklahoma City, April 9. Sec., Dr. J. D. Osborn, Jr., Frederick.

SOUTH DAKOTA: Yankton, June 19. Sec., Dr. G. M. Evans, Yankton.

TENNESSEE: Memphis, March 27-28. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis.

WISCONSIN: Madison, April 7. Sec., Professor R. N. Bauer, 152 W. Wisconsin Ave., Room 834, Milwaukee 3.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

American Journal of Ophthalmology, Cincinnati

27:1339-1466 (Dec.) 1944

- Obstruction of Central Retinal Vein: Clinicohistopathologic Analysis. Bertha A. Klein.—p. 1339.
- Bilateral Metastatic Carcinoma of Choroid with X-Ray Therapy to One Eye: Report of Case. F. C. Cordes.—p. 1355.
- Notes on Operation for Glaucoma. R. J. Masters.—p. 1371.
- Amblyopia in Cases of Reading Failure. T. H. Eames.—p. 1374.
- Angiodiathermy of Long Posterior Ciliary Arteries and Its Use in Treatment of Glaucoma. D. Guerry III.—p. 1376.
- Production of Lens Sensitivity in Rabbits by Brucella Infection. E. L. Burky.—p. 1394.
- Ophthalmoscopic Classification of Hypertensive Diseases. G. E. Clay and M. Baird.—p. 1396.
- Keratoconus Posticus Circumscriptus: Case Report. G. Wise.—p. 1406.
- Clinical Studies in Angiospasm. I. Givner.—p. 1408.
- Frequency of Squint. M. Olive Boyle.—p. 1413.
- Essential Requirements for Good Orthoptic Department. D. Dicke.—p. 1417.
- Precautions Necessary in Orthoptic Training. L. B. Drye.—p. 1422.

American Journal of Physiology, Baltimore

142:633-757 (Dec.) 1944

- Modified Spontaneous Activity Rhythms in Rats. L. G. Browman.—p. 633.
- Relation of Adrenalin and of Carotid Sinus to Hyperglycemia of Shock. E. Mylon, C. W. Cashman and M. C. Winternitz.—p. 638.
- Renal Reabsorptive Mechanism for Inorganic Phosphate in Normal and Acidotic Dogs. R. F. Pitts and R. S. Alexander.—p. 648.
- Spontaneous Activity in Relation to Diet in Albino Rat. Erna A. Smith and R. M. Conger.—p. 663.
- Experimental Chronic Hypertension in Rabbit. A. Grollman.—p. 666.
- Filtration Across Vascular Wall as a Function of Several Physical Factors. C. Hyman.—p. 671.
- Mechanism of Effect of Hyperthyroidism on Cardiac Glycogen. L. E. Moses.—p. 686.
- Oxygen Tension of Arterial Blood and Alveolar Air in Normal Human Subjects. J. H. Comroe and R. D. Dripps Jr.—p. 700.
- Factors Affecting Determination of Oxygen Capacity, Content and Pressure in Human Arterial Blood. F. J. W. Roughton, R. C. Darling and W. S. Root.—p. 708.
- Influence of Dying Gasps, Yawns and Sighs on Blood Pressure and Blood Flow. R. A. Woodbury and B. E. Abreu.—p. 721.
- Hemoglobin Concentrations, Red Cell Counts and Erythrocyte Volumes of College Women of North Central States. Margaret A. Ohlson, Dena Cederquist, Eva G. Donelson, Ruth M. Leverton, Gladys K. Lewis, Williamina A. Himwich and May S. Reynolds.—p. 727.
- *Affinity of Hemoglobin for Oxygen at Sea Level and at High Altitudes. H. Aste-Salazar and A. Hurtado.—p. 733.
- Improved Measurement of Effect of Intravenously Injected Adrenalin on Respiratory Exchange by Colorimetric Determination of Carbon Dioxide in Expired Air and Continuous Graphic Registration of Oxygen Consumption. R. J. Jones and F. R. Griffith Jr.—p. 744.

Affinity of Hemoglobin for Oxygen at Sea Level and at High Altitudes.—Aste-Salazar and Hurtado determined the position of the oxygen dissociation curve in arterial blood obtained from 17 healthy adult men living at sea level and from 12 Indian native residents of Morococha (Peru) at an altitude of 4,540 meters (14,890 feet). The same determination was repeated on 12 subjects of the first group within the first two hours after arrival at a high altitude and on 8 men of the second group also within the first two hours after arrival at sea level. The results were compared with those obtained in previous investigations. There seems to be enough evidence to conclude that in human beings, newcomers or residents, at altitudes of about 4,000 meters, or higher, there is no increased affinity of the blood hemoglobin for oxygen. On the contrary, the findings indicate a slight tendency toward a lower affinity,

both at arterial p_n and a standard p_n of 7.40, especially in the native residents. This right shift in the oxygen dissociation curve at high altitude may be interpreted as a favorable compensatory adjustment to the low pressure environment.

Lesions of Diaphragm.—Kinzer and Cook report 38 cases of diaphragmatic lesions found during the examination of 412,149 chest roentgenograms. Of these only 3 were considered from the roentgenologic standpoint alone to be true diaphragmatic hernias. The first of these was a congenital absence of the posterior portion of the left diaphragm. The stomach, splenic flexure of the colon and several loops of small intestine were herniated into the thoracic cavity. The second was a congenital hernia through the right foramen of Morgagni. The third was a traumatic hernia through the left hemidiaphragm following an inflammatory necrosis. The remaining 35 cases were congenital eventrations of the diaphragm, 30 occurring on the left and 5 on the right side. The authors present roentgenogram of 3 instances of congenital eventration of the right diaphragm.

High Fluid Intake in Management of Edema.—Schemm reports clinical studies on patients who had either severe edema or advanced cardiovascular disease. Treatment consisted in giving large amounts of water orally or by vein and a "neutral" diet to insure reduced amounts of salt and sodium and a slight excess of acid ash. Small amounts of acid drugs were usually given to augment the effect of the diet. If the patient's condition permitted, digitalis, mercurial diuretics and even acid drugs were withheld until the edema cleared; thyroid and vitamin B were given only after edema had disappeared; acacia, hypertonic solutions and aminophylline were not given. The diet protein was sometimes reduced from 65 Gm. to 40 Gm. daily until edema had cleared. The observations were made over a period of eight years in 626 separate periods of treatment of 402 cases. Patients with pronounced edema, 94 per cent with gross cardiopathy, tolerated the high fluid intake and the results were better than those formerly obtained with restriction of fluids. It is suggested that the regimen used is physiologically sound and clinically useful in the correction and prevention of the related phenomena of edema, oliguria or anuria and dehydration. Schemm believes that his observations call for a critical reexamination of the accepted clinical practice of fluid restriction in the presence of edema, and for reevaluation of the accepted hypotheses regarding edema formation and congestive heart failure on which this practice is based.

Amphetamine Sulfate in Obesity.—Albrecht reports the results he obtained in treating 300 obese patients. The dosage varied from 10 mg. to 30 mg. daily in divided doses. Patients were started on 5 mg. of amphetamine sulfate twice daily, the drug to be given one-half to one hour before breakfast and the noon meal. Those who have a light breakfast and who eat their evening meal early were given the drug one hour before the noon meal and at 4 p. m. Nearly all who take the drug lose the uncontrollable desire to eat between meals. Patients* can be put on a diet varying in calories from 450 to 1,500 with an excellent chance that they will stay on it after the drug is discontinued. This is an easy and rapid way to lose weight, and, under the guidance and supervision of a physician mindful of the contraindications to amphetamine therapy, relatively free from ill effects. The weight loss is not permanent; it is transient in the great majority of instances and returns when the drug is discontinued unless the patient remains on his special diet.

Spontaneous Pneumothorax.—Goldman and Roth report 3 cases of spontaneous pneumothorax observed at the Barnes Hospital, St. Louis. The first patient was a man aged 51 with congenital cystic disease of the lung. Removal of a large amount of air and the injection of the patient's own blood into the pleural cavity resulted in a rapid clinical cure. The second patient, a man aged 40, had complete atelectasis of the upper lobe of the left lung associated with a spontaneous pneumothorax. The pneumothorax had been present for eleven months. The collapsed lung rapidly reexpanded following bronchoscopy, and there was no evidence of disease in the lung following reexpansion. A careful survey of the literature shows only 1 previous report of atelectasis following idiopathic spontaneous pneumothorax. In the third case, one of spontaneous idiopathic hemopneumothorax, recovery was followed by a recurrence. This is the third reported case of recurrence of pneumothorax following spontaneous idiopathic hemopneumothorax. It has frequently been stated that adhesions follow hemopneumothorax and prevent recurrence.

Corneal Lesions Following Operations for Trigeminal Neuralgia.—According to Pannabecker members of the department of neurosurgery of the University Hospital at Ann Arbor, Mich., performed operations for trigeminal neuralgia in 878 cases during the period from 1927 to 1943. Corneal lesions followed in 18 per cent of these. It was found that operations on the lower branches of the trigeminal nerve which do not involve the first, or ophthalmic, branch do not cause damage to the cornea. Corneal anesthesia and lagophthalmos are the important factors in the production of corneal lesions. Combined corneal anesthesia and lagophthalmos give the greatest incidence of corneal lesions (65 per cent). With repeated operations a lesion occurring after the first operation may indicate that a lesion is likely to follow the second. But the incidence of lesions was not definitely greater with repeated operations than with single ones. Operations complicated by the presence of a neoplasm are more likely to be followed by paralysis of the seventh nerve and exposure keratitis. But the incidence of corneal lesions was not greater than with other complete rhizotomies. The prospect of neuroparalytic keratitis developing after complete rhizotomy on both sides is not greater than

after a complete rhizotomy on one side and should not deter one from bilateral operation if severe pain is present. The patient with corneal anesthesia following operation for trigeminal neuralgia is most susceptible to development of neuroparalytic keratitis during the first few months immediately after operation. Treatment of this condition has varied somewhat, but the importance of closure of the lids has always been recognized. A mild antiseptic, such as an aqueous solution of metaphen 1:2,500 or of merthiolate 1:5,000 is prescribed. Isotonic solution of three chlorides is used frequently during the day if there is an indication of insufficient secretion of tears. Closure of the lids has been obtained by various means, such as padding the eye, closing with adhesive tape, use of the Frost suture and tarsorrhaphy. A Frost suture is the best procedure for temporary closing and is useful when the patient is uncooperative or comatose. A tarsorrhaphy is the best procedure for treating neuroparalytic keratitis or exposure keratitis—either a three band or an Elschuig lateral tarsorrhaphy, as indicated. The tarsorrhaphy should be left in place for six months. Cauterization of the punctum was employed in a limited number of cases. Cervical sympathectomy also has been advised. Prophylactic care should be used with any eye which is anesthetic. Temporal shields may be applied to the glasses, and isotonic solution of three chlorides should be used several times daily if the test for lacrimal secretion shows a deficiency of tears. Early tarsorrhaphy should be performed in doubtful or suspected cases. If the tarsorrhaphy is left in place for six months the patient will have been carried through the most critical period of this disease.

Anterior Poliomyelitis in Pregnancy.—Blair and Robertson present their experience with pregnancy in the presence of maternal poliomyelitis at the Vancouver General Hospital. Six cases were observed over a period of twelve years, during which there were 25,427 deliveries. The first woman, eight months pregnant, died of respiratory paralysis. No Drinker apparatus was available at that time (1931). At necropsy the mother's spinal cord showed the typical changes of poliomyelitis. The fetus was well formed, and the spinal cord showed no pathologic changes. The second woman was admitted during the sixth month of pregnancy with paralysis of the lower limbs. Four weeks later a premature child died several hours after birth. Examination of the infant's spinal cord revealed no abnormalities. The mother's convalescence was uneventful. The third woman was in her sixth week of pregnancy and was admitted with neck stiffness, pain in the lumbar region and thighs and weakness of the extensor muscles of the thighs. She aborted spontaneously six days after admission. Her subsequent course was uneventful. The fourth patient had been pregnant four and one-half months when she entered the hospital complaining of nausea and vomiting, crampy pains in the calves and thighs, and soreness and stiffness of the neck and back. She was discharged after twenty days and later had a normal delivery. The fifth patient was admitted when six months pregnant with headache and pain in the lower legs and back. Both knee

jerk and the right ankle jerk were absent. There was a complete paralysis of the right lower limb and weakness of the left. She was discharged one month later with persisting paralysis of the flexors of the right hip and of the right tibialis anterior muscle. The patient was subsequently delivered, the course of labor being normal, as was the child. The sixth patient was three months pregnant when she developed symptoms of poliomyelitis and had to be placed in a respirator because of complete paralysis of the diaphragm and intercostal muscles. She gradually improved and at the time of her delivery was able to be outside the respirator for eleven of the twenty-four hours daily. She was taken to the labor room in the respirator but was removed from it for the actual delivery. The puerperium was normal. Paresis of the lower extremities and lower torso cleared early and her chief paresis was in the chest, arms and neck. She was conscious of labor pains and was able to help expel the baby over the perineum. The baby is well developed. The mother now walks about. The virus of poliomyelitis has never been demonstrated in the blood stream. If it is present it is never sufficient to invade the fetus. The safety of the child in utero, even in the presence of the most virulent attack compatible with life, is well demonstrated in this series.

Penicillin in Pediatrics.—Penicillin has been used in the pediatric service of the Mayo Clinic in the treatment of 54 patients with various types of bacterial infection. For the local treatment of most bacterial infections in infants a total daily dose of 20,000 to 40,000 units of either the sodium or the calcium salt appears to be adequate. For larger children a total daily dose of 60,000 to 80,000 units is as a rule enough with the possible exception of cases of overwhelming sepsis, in which it may be desirable to use as much as 100,000 to 150,000 units. For the local treatment of wounds involving soft tissues as well as bone, saline solutions containing 250 to 500 Oxford units of penicillin per cubic centimeter are suitable. Penicillin may be administered locally in the form of the dry substance alone or in combination with sulfanilamide. These sulfanilamide-penicillin powders usually contain 5,000 units of penicillin per gram of sulfanilamide. Penicillin may also be administered locally as a cream containing 250 units of penicillin per gram. For local therapy the calcium salt of penicillin is preferred to the sodium salt. For systemic administration to infants the intermittent intramuscular method is the best. From 3,000 to 5,000 units should be administered in 1 or 2 cc. of isotonic solution of sodium chloride every three hours, day and night. In overwhelming sepsis as much as 10,000 units may be given by the intramuscular method every three hours. In larger children penicillin can be administered by the continuous intravenous drip. In certain instances, such as extensive burns, in which suitable sites for intramuscular injection are not available, it may be desirable to resort to the infusion of penicillin by way of the bone marrow. The sternum or clavicle can be used satisfactorily. Forty-five of the 54 cases responded favorably. Penicillin was effective in bacteremia, severe cellulitis, acute osteomyelitis, meningitis, pulmonary suppurative disease, certain pyogenic skin infections, otitis media, actinomycosis and a group of miscellaneous infections including septic arthritis and ocular infections. Penicillin is of little or no value in gram negative bacillary infections, including undulant fever, tularemia, influenza or infections due to the colon-typoid-dysentery group of organisms or to Friedländer's bacillus. Infections of the urinary tract due to the gram negative organisms do not respond to penicillin. It is of no value in tuberculosis, acute rheumatic fever, rheumatoid arthritis, ulcerative colitis, malaria or blastomycosis. It is useless in leukemia as well as in certain skin diseases including lupus erythematosus. The advantage of penicillin over sulfonamides resides not only in its greater antibacterial powers but also in the low incidence of toxic manifestations.

Neutralization of Gastric Acidity.—Krantz and his associates observed the lag in acid absorbing and neutralizing capacities of various samples of aluminum hydroxide gel. A new compound, the basic aluminum salt of aminoacetic acid, was found to have the capacity to buffer and neutralize hydrochloric acid. Its prompt and prolonged buffering of acid suggested its use in the treatment of hyperacidity and peptic ulcer. On the basis of the aluminum content, basic aluminum aminoacetate is 42 per cent more efficient in acid consuming power than dried aluminum hydroxide gel. Feeding studies on rats did not result in abnormalities. Basic aluminum aminoacetate was administered to 20 persons in doses of 2 to 4 Gm. in powder form suspended in water. It was tolerated without symptoms. Two patients with active peptic ulcer were treated with the salt as the sole antacid. Healing was observed by the gastro-scope and the patients became asymptomatic. In 2 cases of latent peptic ulcer with postprandial distention and hyperacidity prompt and prolonged relief followed ingestion of 0.5 Gm. compressed tablets of the salt. Extensive clinical investigations with the compound are in progress.

Sulfadiazine as Prophylactic Against Respiratory Disease.—Hodges states that hospital admissions for streptococcal and pneumococcal infections from an Army Air Force technical school rose alarmingly during January 1944. The experience of the previous year suggested that serious epidemics were beginning. Administration of sulfadiazine was made

throughout February and March. The results appeared to be beneficial. The most striking effect was on beta-hemolytic streptococcus infection. It appeared that streptococcal sore throat and scarlet fever could be reduced almost to zero. There was a less evident but still significant effect on pneumococcal infection. Sixteen weeks after the onset of the epidemic of streptococcal infection the incidence of acute rheumatic fever was well below the accepted rate. Ordinary respiratory disease also showed a response to the drug. This is thought to be due to the fact that streptococci and pneumococci give a clinical picture indistinguishable from that of the common cold, although this concept remains to be proved. A variety of dosages was tried. It is believed that the optimal dosage for a given group should be worked out individually. No serious untoward reactions occurred.

High Altitude Anoxia.—Fatalities in air crews due to deprivation of oxygen during bombing operations at high altitude afforded an opportunity to study the gross and microscopic anatomy of acute anoxia in man as it occurs at low atmospheric pressure. Twenty-seven necropsies were performed during 1943 in one hospital on members of high altitude bomber crews in which death had been attributed to anoxia by the Air Force medical officers who investigated the cases. Widespread, severe capillary congestion was found. This was conspicuous and most constant in the pulmonary, renal, intestinal and cerebral capillaries. The skeletal muscle did not show this congestion. In a high proportion of cases the systemic venous and the portal circulations showed gross and microscopic congestion, with dilatation of the right ventricle. There was wide individual variation in the incidence, location and amount of edema and hemorrhage. An exception to this was the consistent occurrence of hemorrhage in the thymus and in the middle ear. Swelling of endothelial cells of capillaries of the renal medulla was observed. The presence of fat free and glycogen free vacuoles previously described in the myocardium and liver and less frequently in cells of other organs was confirmed. These vacuoles occurred with equal frequency in cases of anemic anoxia (acute carbon monoxide poisoning) but were rarely found in the tissues in nonanoxic control cases.

*Carbon Dioxide by Inhalation in Management of Cough. A. L. Banyai and A. V. Cadden.—p. 111.

Mass Miniature Radiography in Royal Air Force. R. R. Trail and others.—p. 116.

Inhalation of Carbon Dioxide for Cough.—Banyai and Cadden have used carbon dioxide by inhalation as an expectorant in pulmonary tuberculosis for the past thirteen years. It changes an excessive yet unproductive cough into a useful cough and thereby often helps to eliminate the dangers inherent in an accumulation and retention of inflammatory products. Carbon dioxide liquefies the mucopurulent exudate in the bronchi and reduces its viscosity; the sputum is loosened up and consequently is expectorated without strain or effort. Adequate evacuation of the bronchi ensures comparatively long periods of rest free from annoying cough. The apparatus used by the authors consists of a tank containing a mixture of 10 per cent carbon dioxide and 90 per cent oxygen. An oxymeter regulates the flow of gas per minute. In some patients it was found expedient to give the inhalation through a glass tube instead of the mask. The open method is recommended for patients who are debilitated or who show some side effects when the closed inhaler is used. The meter is set for 4 to 5 liters per minute for closed inhalations and for 5 to 7 liters per minute for the open method. The treatments vary in length from five to fifteen minutes, and the inhalations are administered once, twice or three times a day. It is necessary to observe the patient closely during the first treatment. If it is noted that the respirations become too strenuous, the inhalations should be given with brief (one minute) interruptions. In the beginning the treatments are given daily; subsequently the frequency of inhalations can be reduced. Almost all patients tolerate carbon dioxide inhalations well, provided the amount of the inhaled gas and the timing of inhalations are individually adapted to the patient's requirements. In some patients they noted transient minor side effects, such as hot sensations, palpitation, weakness, frontal headache and slight dizziness. None of these symptoms interfered with the treatment when proper adjustments were made in the method of administration. The liquefying effect of carbon dioxide on mucus in the bronchial tract is greater than that of the commonly used expectorants. Carbon dioxide by inhalation occupies a unique place among expectorants in that, besides its liquefying action, it is capable of stimulating the respiratory center. Stimulation of the respiratory center causes increased respiratory expansions of the thorax, a consequent stretching and dilatation of the bronchi and an increase in the bronchial peristalsis. These factors contribute substantially to the effective mechanical elimination of inflammatory products from the respiratory tract.

General Anesthesia in Shock.—Crooke and his associates show that operations on seriously shocked patients are associated with a notoriously high mortality. This may be due to the further loss of blood entailed during the operation, to the stimulus of the operative manipulations or to the anesthetic. It has become apparent that the most important single factor has been the anesthetic, and an examination has therefore been made of the effect of different anesthetics on the cardiovascular systems of 26 patients with normal plasma volumes, of whom 19 underwent various major operations—the majority a partial

gastrectomy. In all cases the pulse and respiratory rates and the blood pressure were recorded at about three minute intervals. Determinations of plasma volume were made and the dye concentration curves followed at about thirty minute intervals until the end of the operation. The hemoglobin was also determined at the same intervals. Electrocardiographic records were made of 9 patients who underwent major operations. The anesthetics used were nitrous oxide, oxygen and ether, cyclopropane and oxygen, sodium pentothal and spinal analgesics. No significant changes were found, although great alterations in blood pressure occurred. Serial electrocardiograms in 9 patients showed a constant change even though a considerable alteration in blood pressure had taken place. It is concluded that anesthetics affect blood pressure mainly through the vasomotor system. Cyclopropane and oxygen tended to raise the blood pressure; nitrous oxide, oxygen and ether had variable effects on it; sodium pentothal and spinal analgesics depressed it. In a patient whose plasma volume was reduced by trauma there was a greater tendency for these anesthetics to depress blood pressure. Cyclopropane and oxygen was the best and nitrous oxide with adequate oxygen and a minimal amount of ether was the next best anesthetic for these cases.

Penicillin Pastilles in Oral Infections.—MacGregor and Long selected gelatin as a medium for penicillin pastilles. Care was taken that the penicillin was not subjected to excessive heat; it was added to the gelatin base at 42 C. and stirred in just before the latter was about to set. Pastilles were cut to a standard size of approximately $\frac{3}{8}$ inch square and $\frac{1}{8}$ inch thick to facilitate insertion and retention in the buccal sulcus. It was shown in experiments that the penicillin remained active in the gelatin base. The standard dose adopted was 500 units of penicillin in each pastille. Each patient was instructed to place a pastille in the buccal sulcus, to leave it there until it had dissolved without chewing or sucking and then to replace it with another. The time taken for the pastille to dissolve varied in different patients and in general tended to be shorter in the earlier and more acute stages of the infection owing to the greater degree of salivation. The average was about three quarters of an hour. The penicillin pastilles were used on 25 patients with acute ulcerative gingivostomatitis (Vincent's type). It was found that this condition can be treated more simply and more quickly with penicillin pastilles than by any other method. The loss of tissue caused by the more usual treatments with caustics and escharotics can be avoided. The penicillin pastilles were used also for 17 patients with acute hemolytic streptococcal tonsillitis, including 4 with scarlet fever. The patients seemed to respond clinically to treatment with pastilles. The effect on the throat flora appeared to be rapid. The early disappearance or reduction in numbers of hemolytic streptococci in the throat suggests that the risk of droplet infection is greatly reduced. The treatment of throat carriers of hemolytic streptococci proved disappointing. It is of interest that they became negative while undergoing treatment. It appeared that surgical conditions of the mouth and throat could be kept free from pathogenic organisms during administration of the pastilles, with gratifying symptomatic relief. On bacteriologic grounds faucial diphtheria should be an indication for treatment with penicillin pastilles.

Flying Bomb Casualties.—Bell describes injuries caused by the flying bomb raids as seen in a small hospital of the Emergency Medical Service. His hospital dealt with 222 outpatients and 236 inpatients, with 18 deaths. Flying glass was the most frequent cause of injury, totaling over 100 casualties. Most of the injuries were above the nipple line, chiefly of the face and neck; a large proportion were received when looking out of windows. There were 5 cases of perforating wounds of both eyes and 10 perforating wounds of one eye. The penetrating power of flying glass is low. Usually it lies just under the skin in the fat, but when present in hundreds of pieces it presents a problem which has not yet acquired a satisfactory solution. The rarity of penetrating wounds is due to the shape of the fragments, which tend to be small flat pieces of metal. Occasionally the bomb fragments are large tangled masses of crumpled sheeting weighing a pound or more, and these may cause severe injuries. In the beginning injuries from masonry were uncommon. Later they became more frequent as adequate

cover was taken, and instead of being killed the victims were buried with various degrees of trauma. There was not a single case of crush syndrome with edema of the injured part, anuria and uremia. This is probably due to the increased speed of the rescue service and possibly to a lessening in the enthusiasm for intravenous plasma therapy. The injuries tended to be severe, and there was a proportionately high death rate (9 out of 52). It was difficult to estimate the number of patients whose lungs were affected by blast and to assess the relative damage caused by blast in contradistinction to other agents. Three patients had severe pain in the chest, breathlessness and traces of blood in the sputum. One of these died. At necropsy he was discovered to have gross contusion of the left side of the brain and of the left lung, a small split in the capsule of the spleen and a hematoma over the left femur. Microscopy showed blood cells among the brain tissues and blood cells in most of the alveoli of the left lung. Many of the alveolar walls were torn. It is difficult to decide on the exact part played by blast in eye injuries. There were 4 hyphemas which were not explainable except as the result of blast. In injuries of the brain it was also difficult to decide whether blast had been the sole agent. Corneal abrasions due to dust were common. The respiratory system also suffered from the effects of dust. At operation the anesthetist remarked time and again on the dirt in the pharynx and trachea. An air raid warden reported that several of the dead had been suffocated by dust, the mouth, nose and throat being completely blocked, while no other injuries were visible. Psychologic shock was the term coined to cover hysteria, fright and mental upset requiring only rest and reassurance.

Fatal Coronary Sclerosis in Boy of Ten.—Jokl and Greenstein report that a boy aged 10 collapsed and died five minutes after a boxing match lasting three rounds. He had received a number of blows against the chest and abdomen but was not knocked down, nor did he seem to be unduly distressed at any time during the fight. At necropsy the left descending branch of the coronary artery was blocked for a distance of about an inch. Above and below the occlusion were slight atheromatous changes in the intima.

*Proteolyzed Liver in Treatment of Refractory Anemias. L. J. Davis and L. S. P. Davidson.—p. 53.
Critical Review of Pernicious Anemia of Pregnancy. Sheila T. E. Callender.—p. 75.

Fibrositis of Back.—Copeman and Ackerman say that the frequency of fibrositis of the back seen among otherwise healthy young men in the army stimulated their interest in this condition. As a first step, exact measurements were taken of the site of the painful focus in a large number of sufferers and a "pain chart" was plotted. The back of every patient who died in the hospital from any cause was then systematically examined, with special reference to these areas. As a result of this and of subsequent clinical observations and biopsies, conclusions have been arrived at which seem to explain certain cases of "fibrositis." The authors say that their previous observation that the painful points may arise during any pyrexial illness or as the result of trauma was confirmed; also that the subjective pain disappears but that the point often remains and can be detected by tenderness on palpation. It can be reactivated subsequently and may become the seat of chronic pain. The back was carefully dissected in 14 bodies with particular reference to the chief sites of pain. It was found that a basic fat pattern was constantly present even in the most cachectic subjects in whom all other fat was absent. This fat pattern was observed to

correspond in shape and situation with the pain pattern. No lesions suggestive of inflammatory reaction were found in any deep fibrous tissue, but abnormalities affecting the lobules of the fat pattern were found on several occasions. The abnormality which seemed most likely to have clinical significance was the herniation of fat lobules through the walls of their investing fibrous tissue. These fat hernias have been classified into three types: the nonpedunculated, the pedunculated and the foraminal. In the nonpedunculated type, fat which lies under a fascial covering, as for instance in the angle of the deep fascia where it splits to invest the sacrospinalis muscle, or along the crest of the ilium, is always under tension and so will bulge into any potential hernial space that may be present either as the result of congenital weakness or as the result of trauma. The pedunculated type of hernia has been found and removed in several instances. In these cases the onset of the pain was produced by a sudden strain several years previously. It is thought therefore that it is probably a late result of strangulation in a hernia originally of the nonpedunculated type. The foraminal type of hernia was found only along the edges of the sacrospinalis muscles. These areas were exposed in the cadavers, and it was found that the nerves passed out in company with a small artery and vein through a foramen in the deep fascia of the muscle. Overhanging this was a narrow lateral fold of the fascia so arranged as to occlude the foramen on flexion of the back. In several cases it was seen that this mechanism had apparently proved ineffective and a small tuft of fat lobules had also herniated through the foramen. The authors suggest that the anatomic conditions which they have described represent a comparatively advanced stage in the process and that to explain the minor and less localized degrees of fibrositis it is not necessary to postulate actual herniation of fat tissue. They describe biopsies on 10 selected patients with fibrositis. Their observations at biopsy led them to evolve a technic of treatment which they call "teasing" the nodule. This consists in anesthetizing a small area of skin over the site of the trigger point, which has previously been ringed with a skin pencil. It is then transfixed with a stout rigid needle, and after injection of 10 to 20 cc. of 1 per cent procaine solution under the greatest pressure possible the point of the needle is swept round deeply in such a way as to undercut the nodule.

Proteolyzed Liver in Refractory Anemias.—Davis and Davidson administered orally proteolyzed liver, a papain digest of whole liver, to 13 patients with severe anemia refractory to treatment with potent liver extracts administered parenterally. In 5 patients the morphology of the peripheral blood and sternal marrow was respectively macrocytic and megaloblastic. A megaloblastic marrow smear is identical in appearance with that seen in Addisonian pernicious anemia in relapse. In such smears a high proportion of the erythroblasts are large cells with abundant dark blue cytoplasm and large nuclei displaying a finely reticulated structure in which nucleolar remnants may or may not be seen. Many of the more mature red cell precursors which show varying degrees of hemoglobinization are distinguished from normoblasts by their relatively greater size and particularly by the loosely woven character of the nuclear chromatin. The 5 patients with refractory anemias with megaloblastic sternal marrows were an elderly woman, a child, a middle aged man, a young man and a young woman in the puerperium. In all these 5 patients administration of proteolyzed liver resulted in a prompt and vigorous hemopoietic response and the rapid restoration of the patient to normal health. In 3 other patients the anemia was also macrocytic, but the sternal marrow films showed dimorphic erythropoiesis. The authors consider the term dimorphic a convenient provisional designation for sternal marrow films showing erythropoiesis which is predominantly normoblastic but partially megaloblastic. In these 3 patients treatment with proteolyzed liver was followed by only partial blood regeneration with the survival of the patients in moderate health. The remaining 5 of the 13 patients had anemia of the aplastic type with hypocellular normoblastic sternal marrow, and they completely failed to respond to proteolyzed liver or to any other form of treatment. It is suggested that proteolyzed liver contains in a readily assimilable form some hemopoietic maturation factor additional to the antianemic factor present in fractionated liver extracts.

Honey in Treatment of Chilblain, Ulcers and Wounds.

—Yang says that in the dermatologic clinic of the National Medical College at Shanghai cod liver oil ointment has been used in the treatment of chronic leg ulcers and small wounds and has been found to be very effective. This success is attributed to its rich vitamin A content, which has the property of stimulating epithelization and granulation tissue formation. After the medical college was moved to Kunming in 1939 the difficulty in obtaining cod liver oil prohibited its further use. It occurred to the author that honey might be employed as a substitute, the rationale of such treatment being that, owing to its high sugar content, it is bacteriostatic; while, owing to its yellow pigment, it might be rich in vitamin A. A honey ointment was made by the addition of 20 per cent of petrolatum. The ointment was first used with encouraging results in leg ulcer. Later when the medical college was moved from Kunming to Chungking it was decided to resume the honey treatment, but, since petrolatum was not obtainable, lard was used instead. The ointment, composed of 80 per cent honey and 20 per cent lard, was used in 50 cases of chilblain, chilblain ulcers, ordinary ulcers and small wounds. Its success in hastening the subsidence of passive hyperemia and edematous swelling, and in stimulating epithelization and granulation tissue formation, was great. Its application is simple and convenient, and its sources of supply are plentiful, thus being especially useful under present wartime conditions.

Liver Puncture in Diagnosis of Liver Diseases.—Hatiganu

and his associates report 45 cases in which a 2 cc. glass syringe and a long thin needle were employed in puncture of the liver. Puncture should be performed in the morning on an empty stomach half an hour after the administration of 15 drops of pantopon (a mixture of the hydrochlorides of opium alkaloids, containing 50 per cent of anhydrous morphine hydrochloride). By applying slight suction a punctate may be obtained rich in liver tissue with only a small amount of blood. The term hepatogram is applied to the cytologic preparation of the punctate on the microscopic slide. Liver puncture was performed in 11 cases of tumor of the liver, proving its value as biopsy. A definite early diagnosis in the initial stage of carcinoma was made from the hepatogram, which is characterized by lack of uniformity of the cells associated with an abnormal increase and irregular arrangement. Liver puncture is an aid to differential diagnosis of liver carcinoma from liver sarcoma, particularly from that of melanosarcoma. The deep dark pigment in the form of round, egg shaped granules fills almost the entire protoplasm of the cell and is localized about the nucleus. Cellular alterations may likewise be demonstrated on the hepatogram of grave cases of parenchymatitis of the liver, particularly in icterus of cholangitic type. Puncture may be of practical importance in cases of pigmentary cirrhosis in which medium sized, single or accumulations of brown granules may be found within or outside the protoplasm even in atypical cases which do not

present bronzed skin. Immature blood elements may be demonstrated in the hepatogram in leukemia; the premyelocytes and myelocytes may be predominant; there may be a few myeloblasts, and basophil erythroblasts may likewise be found. The microscopic picture of a hepatogram in acute leukemia resembles that of the myelogram, so that liver puncture may be dispensed with in these cases, although it may have its value in aleukemic and erythroblastic leukemia. In pernicious anemia the megaloplastic function of the liver may be demonstrated in the hepatogram. Liver puncture may reveal the causative agent in cases with a slow septic course and may clarify the bacteriologic diagnosis of the condition.

- *Vagus-Sympathetic Block. A. V. Vishnevskiy.—p. 16.

Vagus-Sympathetic Block in Shock.—Skvortsov applied the method of procaine hydrochloride infiltration anesthesia of the vagus nerve and the sympathetic nerve in the neck in a variety of war casualties such as open pneumothorax, abdominal operations and lesions of extremities when the men were brought in in a state of shock. In cases of open pneumothorax the method resulted in raising the blood pressure in from five to ten minutes 13 to 15 mm. of mercury in 88 per cent of the cases. Pain and dyspnea disappeared in about 91 per cent, the cough reflex disappeared and manifestations of shock gradually disappeared in the course of an hour and a half to two hours. The fact that the vagus-sympathetic block raises the blood pressure within three to five minutes of its application suggests that its effect is accomplished by the stimulating action on the cardiovascular nervous system. The blood pressure sometimes is raised above that of the normal pressure for the individual. The effect lasts in normal persons for from two to three hours, that is, until the procaine solution is absorbed. In cases in which the block is ineffective the author advises a second infiltration two to three hours later. Bilateral infiltration is advisable in cases of low blood pressure and slow pulse or in cases in which unilateral block does not produce an improvement in blood pressure. Combination of vagus-sympathetic block with blood transfusion gives better results in traumatic shock than transfusion alone. Thus in shock of medium or grave degree transfusion of a liter of blood and of 270 cc. of substitute fluid gave on an average 25 mm. of mercury rise of blood pressure. In other words, for each 500 cc. of transfused blood there was a rise of blood pressure amounting to 10 mm. When the blood transfusion was combined with the vagus-sympathetic block the blood pressure in patients with shock, transfusion of 500 cc. of blood and 220 cc. of blood substitute gave an average rise of 22.5 mm. The effect of the block can be utilized not only in traumatic shock but in all states accompanied by collapse and hypoxia.

Vagus-Sympathetic Block.—According to Vishnevskiy, the physiologist Morrison called attention to the fact that section of the vagus nerve in the neck prevented the development of grave reflex manifestations on the part of respiration and cardiovascular function in the course of pneumonectomies in dogs. Vishnevskiy applied this principle in his operations on the human thorax. Instead of sectioning the nerve he utilized the method of creeping infiltration with a weak (0.25 per cent) solution of procaine hydrochloride. From 60 to 80 cc. of this solution is slowly injected at the edge of the sternocleidomastoid muscle above the point where it is crossed by the external jugular vein. The procaine solution slowly spreads and comes in contact with the perineural surfaces of the vagus, the sympathetic nerve and the phrenic nerve. The method proved to be very effective in the prophylaxis and therapy of pleural pulmonary shock. The author stresses the advantages of using a weak solution of procaine and its gradual penetration to the perineural tissues of the nerves.

Book Notices

Surgery of the Hand. By Sterling Bunnell, M.D. Cloth. Price, \$12. Pp. 734, with 597 illustrations. Philadelphia, London & Montreal: J. B. Lippincott Company, 1944.

This well written and beautifully illustrated monograph by America's foremost exponent of the surgery of the hand represents the work of a surgeon's lifetime. It obviously cannot be reviewed in adequate fashion in a few brief paragraphs. One should simply state that it deserves careful reading and study by every surgeon interested in the surgery of the upper extremity.

Although the title stresses the hand, it might have been "The Surgery of the Upper Extremity," for its scope is much broader than the simpler title indicates. The volume is divided into four parts. The first part includes a discussion of the comparative anatomy and a detailed description of the normal hand. Part 2 is devoted to the reconstruction of the hand and includes the subject of contractures, bone and joint disabilities, nerve and tendon injuries, and in a fifty page section on the arm in its relation to the hand subjects as diverse as sternoclavicular and acromioclavicular dislocations, recurrent dislocation of the shoulder, brachial plexus injuries and "tennis elbow." Part 3 is devoted to the treatment of injuries and infections of the hand and part 4 to congenital deformities, vasomotor and trophic conditions and to tumors, the latter section written by Dr. L. D. Howard Jr.

Part 2, devoted to the reconstruction of the hand and constituting approximately 380 of the 700 pages of the volume, describes the procedures which we have come to associate particularly with the author's name. Operations on the joints, nerve suture and the use of nerve grafts to fill defects, tendon suture and tendon grafting are described and illustrated in the clearcut fashion characteristic of the author's surgical papers. Because of the wealth of material presented and the many somewhat complicated technical procedures described it is difficult for a reviewer to choose any single subject or group of subjects and attempt to present the author's ideas or to evaluate them critically. One suggested procedure perhaps should be mentioned, both because of its importance and because it seems inconsistent with the admirable principle of "atraumatic technic" which the author has emphasized so forcefully. In discussing "debridement or excision of wound" (pp. 451-452) following injury of the hand, the author suggests that one "... so up the wound in all its interstices with a half-strength tincture of iodine as used on skin and then blot it dry at once to limit its action on the surface. This destroys surface bacteria and so marks the tissue that every particle can be excised. With toothed forceps and sharp plastic scissors (curved, flat and double pointed) the complete surface of the wound is systematically excised for 1 or 2 mm. deep, or more if necessary, to remove all nonviable tissue. First, the complete skin margin is excised, and circling deeper and deeper in the wound all is excised so completely in a dry and bloodless field that not a crumb of marked tissue remains. Exposed nerves, tendons, articular surfaces or essential structures are spared. The tendon and nerve ends are thinly clipped off, and ends of fractured bones are chiseled off to good bone. On completion we have a clean surgical wound lined with viable tissue free from bacteria, traumatized tissue and chemical." With a part of the body in which essential structures are packed so closely and lie so close to the surface, such a method of converting an open wound into a clean wound seems both ill considered and unnecessarily destructive.

One can say without exaggeration that no one heretofore has attempted so comprehensive or detailed a presentation of the surgical treatment of disabilities of the hand, and no surgeon who cares for such injuries or disabilities should fail to give this volume the considered attention it richly merits.

Crime and the Human Mind. By David Abrahamsen, M.D., Department of Psychiatry, Columbia University, New York. Cloth. Price, \$3. Pp. 244. New York: Columbia University Press, 1944.

The claim that is made on the jacket of this book that this is the first volume to deal comprehensively with the psychiatric aspects of crime is untrue. Other books dating back to the end of the last century have been published on the subject, and

many of them in their day were better than this one. True, Abrahamsen has brought under a single volume many of the more recent concepts of criminologic psychiatry, but his point of view seems to be extremely limited for a volume which has ten pages of bibliography. The author's point of view seems to be limited to a few of the most common articles on the subject having to do with criminologic psychiatry, and there is a preponderance of material coming from New York and perhaps an overemphasis on the reports of the Court of General Sessions Clinic.

The subject matter included in this volume deals with criminology as a science, the mind in relation to crime, heredity and environment as causes of crime—truly an unusual use of the word "cause"—the functional view of the offender, the psychiatric-psychologic examination of the offender, the psychology of the individual offender: classification, juvenile and war delinquency, the psychiatric-psychologic background of murder, the psychiatrist and the criminal law, and treatment and research.

Dr. Abrahamsen's career, as it is described on the jacket, would seem to give him an unusually fitting background to write a volume on psychiatry and crime, for he has been at St. Elizabeths Hospital in Washington, at the Illinois State Penitentiary and at the Psychiatric Clinic of the Court of General Sessions, but the book seems to be peculiarly impractical. There are case histories given, but they lack the quality of reality. The bibliography too is peculiar. Little known works of rather insignificant authors on criminologic subjects are quoted, yet two or three psychiatrists who have contributed hundreds of articles to the literature, including several important monographs, are almost entirely ignored. In spite of these criticisms the book is interesting, carrying with it a limited amount of authenticity. Its use as a reference book, while limited, is justified and is definitely a step in the right direction of trying to make available for those who know little about it some phases of the relationship of crime to psychiatry.

Practical Methods in Biochemistry. By Frederick C. Koch, Director of Biochemical Research, Armour & Co., Chicago, and Martha E. Hanke, Associate Professor of Biochemistry, University of Chicago. Fourth edition. Cloth. Price, \$2.25. Pp. 353, with 20 illustrations. Baltimore: William Wood & Company, 1943.

This edition presents the more important qualitative and quantitative aspects of cell constituents, of cell activities and of the composition of blood, secretions and excretions. The book is divided into three parts: (1) the chemistry of cell constituents, (2) the chemistry of the digestive tract and (3) blood and urine. Part 1 contains chapters dealing with carbohydrates, lipins, proteins and amino acids, nucleoproteins and nucleic acid, and hydrogen activity and pH . Part 2 contains chapters devoted to salivary digestion, gastric digestion, intestinal digestion and bile. Part 3 has chapters on blood and hemoglobin, the quantitative analysis of blood, the quantitative analysis of urine, the chemical examination of urine for pathologic conditions, colorimetric methods for vitamins, and chemical tests for hormones. With each quantitative method are given the principle, the reagents and the actual procedure. The book could be considerably enriched by adding to each method a paragraph or two with biologic normals and clinical interpretations. The chapter on vitamins gives quantitative procedures for tissues and foods, but no such procedures for blood and for urine, which could have easily been incorporated. It is also to be regretted that spinal fluid is altogether left out of consideration. It is to be hoped that in the next edition clinical interpretations will be added as well as a chapter on spinal fluid, and that the chapters on vitamins and on hormones will be expanded to include quantitative methods for blood and urine.

The book is written in an exceptionally clear and fluent style, and the directions for various qualitative and quantitative procedures are simple, free from ambiguity and easy to follow. Explanations are freely used. The most valuable chapter in the book is the one discussing hydrogen activity and pH . This subject is put before the student in the most illuminating manner, and the simple experiments in this chapter serve to illustrate fundamental principles. The superiority of the book lies in the choice of up-to-date subject matter. Many manuals published

continue to describe the same qualitative and quantitative procedures that have been used for thirty years or longer and fail to take into consideration new and more sensitive or more accurate methods. Koch and Hanke's book is replete to an agreeably surprising degree with the latest and best methods. Here is a book that is no longer a rehash of the old and the hoary in biochemical technic. Even the ordinary colorimeter has disappeared in the book to be altogether replaced by the more accurate photoelectric colorimeter, in which the personal equation is completely canceled out. The book is highly recommended and should be in the hands of every medical student, clinical pathologist and internist who desires to keep up with advances in the pure sciences intriguingly bound up with medical progress.

Elements of Electrocardiographic Interpretation with Forty Plates Illustrating the More Important Deviations from the Normal, Selected from the Files of the Michael Reese Hospital. By Louis N. Katz, A.M., M.D., Director of Cardiovascular Research, The Michael Reese Hospital, Chicago, and Victor Johnson, Ph.D., M.D. Third edition. Paper. Price, \$1. Pp. 44, with 40 illustrations. Chicago: University of Chicago Press; London: Cambridge University Press, 1944.

P-Q-R-S-T: A Guide to the Interpretation of Electrocardiograms. By Joseph E. F. Riseman, M.D., Associate in Medicine, Harvard Medical School, Boston. Fabrikoid. Price, \$1.50. Pp. 28, with 55 illustrations. Boston: The Author, 1944.

The value of the former booklet is established. The well chosen electrocardiograms, with adequate legends, illustrate the normal and abnormal mechanisms of the heart beat. "The Genesis of the Electrocardiogram" is new and helpful. Additions to the "Table of Characteristics of the Normal Electrocardiographic Cycle," plates illustrating the types and progressive changes of infarction and an illustrated discussion of chest leads are timely. The valuable "Procedure in Reading Electrocardiograms" is retained. The booklet provides useful supplementary material for students and practitioners.

The second booklet, of attractive format, is a detailed outline of graphic abnormalities (illustrated by drawings rather than actual electrocardiograms) and as such is of greatest value to the author.

The Safe Installation and Use of Abrasive Wheels. International Labour Office, Studies and Reports, Series F, Second Section (Safety), No. 9. Paper. Price, \$1; 4s. Pp. 175, with illustrations. Washington & Montreal: International Labour Office; London: P. S. King & Staples, Ltd., 1944.

Grinders are exposed principally to injury arising from breakage of revolving abrasive wheels. Most commonly reported accidents are foreign bodies in the eye, burns and abrasions, or injury arising from contact with unprotected parts of the machine. This booklet, intended primarily for safety engineers, will, however, be a useful source of reference to physicians who encounter accidents of this type or who are called on to recommend improved health or safety measures. Complete data are presented about storage, proper wheels for particular work, speed of operation and stresses involved therein, mounting of the wheel and the precautions which workers must observe. Guarding receives exceptionally thorough treatment. Goggles or face screens need to be worn or transparent screens should be installed on the machine itself to protect the operator against sparks or dust. Local exhaust ventilation is regarded as the most reliable method of removing excessive concentrations of dust.

Rebel Without a Cause . . . The Hypnoanalysis of a Criminal Psychopath. By Robert M. Lindner, Ph.D., Psychologist, United States Penitentiary, Lewisburg, Pa. Introduction by Sheldon Glueck, LL.B., Ph.D., Professor of Criminal Law and Criminology, Law School, Harvard University, Boston, and Eleanor T. Glueck, Ed.D., Research Criminologist, Law School, Harvard University. Cloth. Price, \$4. Pp. 296. New York: Grune & Stratton, 1944.

This entire book is written around the partial contents of forty-six hours of hypnoanalysis of a criminal psychopath. Preceding the single case report the author makes a few general remarks about the nature of psychopathic personalities and their evolution. To this subject his discussions add nothing new. The method of hypnoanalysis is then outlined and many current misconceptions are negated. In this discussion the positive contributions are worth studying, but the author's gratuitous

ridicule of other methods is distracting. Then come 260 pages of case history and details of forty-six hours work. This is given in great detail, although of necessity abstracted to some degree. Page after page of the patient's production are cited with only an occasional question from the therapist. In the later hours the author became more curious and asked more questions and makes a few interpretations. One misses the analytic work of the therapist until the last hour, when a total explanation of the case is briefly given. This concerns a traumatic incident that occurred in infancy: "You were between 6 and 8 months old." The night before the child had been frightened by a dog in a motion picture. The next morning the patient saw his father having intercourse with the mother and his penis looked like a strange and vicious animal. The child knew he wasn't supposed to see all this. At breakfast he was frightened and cried. "Now the fear of your father's penis—and all it meant—followed you through all your life." To this traumatic incident the patient's lifelong nystagmus, amblyopia and ptosis and his psychopathy are attributed. The reviewer can make no comment regarding this claim except to point out that if a child of 6 months is able to grasp such a set of circumstances much indeed has been learned. A short summary follows in which the author states, "In short, hypnoanalysis is a radically abbreviated method for the investigation of the personality and the treatment of psychogenic disorders and aberrations of behavior."

Recent Advances in Anesthesia and Analgesia (Including Oxygen Therapy). By C. Langton Hewer, M.B., B.S., D.A., Senior Anesthetist, St. Bartholomew's Hospital, London. Fifth edition. Cloth. Price, \$5.50. Pp. 343, with 141 illustrations. Philadelphia: Blakiston Company, 1944.

That a fifth edition of this invaluable manual should appear within two years of the publication of the fourth is a well merited tribute to its excellence. A good and fair description of "controlled respiration" has been added to the first chapter. The author has wisely modified his previous statement as to the effect of trichlorethylene on cardiac rhythm and now admits that arrhythmia occurs. A section dealing with wounds involving the mouth has been added to the chapter on anesthesia for oral operations, and anesthesia for thymectomy is considered in the chapter on thyroidectomy. A new chapter has been added on anesthetic charts and records, and the addition is timely and wise. To the professional anesthetist the book is indispensable because of the care and discrimination with which the references are selected, for the latter make the book a "starting point" for almost any investigation. In spite of the additions the book is not larger than before, and the printing and binding are astonishingly good in view of the prevailing restrictions. All anesthetists are indebted to Dr. Hewer's industry and learning for a work which is of vital importance to them.

The Art of Resuscitation. By Paul J. Flagg, M.D., Chairman, Committee on Asphyxia, American Medical Association. Cloth. Price, \$5. Pp. 453, with 176 illustrations. New York: Reinhold Publishing Corporation, 1944.

This volume, as the author states, is an attempt, based on more than twenty-five years of intimate experience with the unconscious patient, to tell the reader what to do when faced by an acutely asphyxiated patient about to die. The author has gathered together the essence of the papers that have been published on the subject of asphyxia and of resuscitation. He has spoken about it historically and from experimental and clinical points of view and has described asphyxia due to a variety of conditions and circumstances. His hobby, pneumatology, is described and recommended. He has covered asphyxia from the fetus to the death of the adult. There are a number of illustrations to assist in making his various points. An extensive bibliography precedes the index. Almost all methods of artificial respiration, both manual and mechanical, are illustrated. Most physicians should be more interested in artificial respiration than they are at present. The author emphasizes the important point that most physicians are not interested in artificial respiration and would prefer to call the fire department rather than to know how to do it themselves, and that this is an unhappy situation. He has done all he can to remedy this situation by preparing this book.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

ETIOLOGY OF INFECTIOUS HEPATITIS FOLLOWING YELLOW FEVER VACCINE

To the Editor:—In the literature on jaundice as caused by yellow fever vaccine which contained human serum, the latter has been said to be the probable source of the icterogenic virus or substance responsible for the hepatitis. Since human serum has been suspected in this connection, I am curious to know whether any similar increased incidence of infectious hepatitis has been noted in persons who have merely received transfusions of whole blood, especially during the subsequent three to twelve months interval? Would not such a statistical study decide definitely whether this icterogenic factor in serum was or was not at fault in the post-vaccinal jaundice?

Captain, M. C., A. U. S.

ANSWER:—There has not been any increase in the incidence of infectious hepatitis following transfusion of whole blood, or of serum or of plasma of similar magnitude to that following yellow fever vaccine. Studies of this incidence have not by themselves been conclusive in incriminating the normal serum which previously was included in yellow fever vaccine. There have been, however, some instances, with probable causal relationship, in which infectious hepatitis followed such transfusions after long intervals similar to those which occurred between injections of certain lots of yellow fever vaccine in 1942 and the appearance of jaundice. A possible explanation of the difference in incidence is that in the case of the yellow fever vaccine exceedingly small amounts of pooled normal human serum were used, around 0.04 cc. per dose: in such a small amount of serum an infecting dose of the hypothetical virus might be present without there being available an effective amount of accompanying specific antibodies which a larger dose of serum or blood would be likely to contain. Moreover, the very small amount of serum in the vaccine implies that a given icterogenic pool containing the serum of an infrequent human carrier would be distributed among thousands of doses of the vaccine. It has been noted also that certain pools of convalescent serum against mumps and measles, when given in considerable volume, produce numerous cases of infectious hepatitis, perhaps because they do not happen to contain an appreciable amount of specific antibody. In any event the evidence of the presence of an icterogenic virus in the blood of occasional human carriers is rapidly growing. The infection has been transferred to human volunteers by inoculation of serum in cases of postinoculation and other types of infectious hepatitis. Moreover, jaundice has ceased to appear in the large number of persons who have been vaccinated against yellow fever since serum was omitted in the manufacture of the vaccine. As susceptible species other than man have not been discovered, the proof of the etiology of postinoculation infectious hepatitis has not been completed by the isolation of the agent. Much, however, is already known about the supposed virus: it is filtrable and unusually resistant to heat, withstanding 56 C. for an hour.

LARGE DOSES OF ASCORBIC ACID

To the Editor:—Can you give me any information as to the toxic effect of continued large doses of ascorbic acid (600 to 1,000 mg. daily)? An adult patient took up to 1,000 mg. of ascorbic acid daily on his own initiative for relief of hay fever. He observed that he was free from migraine headaches, which had previously occurred three or four times a month for almost fifteen years. The patient is anxious to know whether he can safely continue to take this large amount of ascorbic acid. M.D., New York.

ANSWER:—There is little danger of harm resulting from large doses of vitamin C. Repeated doses of this vitamin have been administered to adults in amounts of 1 to 6 Gm. orally and intravenously without evidence of toxic action. Daily doses of 1 to 3 Gm. over an extended period caused no undesirable effect. In infants and children vagotonic effects such as fatigue, slow pulse, increased intestinal peristalsis and hyperemia have been noted with the use of maximal doses of vitamin C. This has been considered by some to be a sensitivity rather than a toxic manifestation.

The dose mentioned in the inquiry is not excessive and should cause no harmful effect.

SUBSTANCES USED TO INHIBIT CORROSION IN BOILERS

To the Editor:—Is it safe to use "Corrodicide" or "Coraval" in hot water boilers from which steam goes to direct contact with food in pressure cookers? "Corrodicide" is supplied by the Metropolitan Refining Company of New York and "Coraval" is a product of the Western Chemical Company of Kansas City.

Arthur E. Wade, M.D., Seattle.

ANSWER:—Modern practice in the prevention of scaling and corrosion in boilers and hot and cold water systems makes use of a wide variety of organic and inorganic substances, including a small number of materials that may be volatilized and carried throughout the entire system along with steam. These inhibitor materials include zinc, manganese and chromium salts, soluble silicates such as sodium and ethyl, pyrophosphate, hexameta-phosphate, sodium septaphosphate, trisodium and disodium phosphate, sodium carbonate and amines. Not all of these substances reach foods subjected to pressure and heat from steam created in a boiler containing these substances. Many appliances, such as steam tables, produce heat or steam without any direct connection with the steam generated in the primary boilers. Whenever practical, that type of device making use of secondary systems is preferred. Frequently claims are made that corrosion inhibitors are nonvolatile and therefore never reach steam. Theoretically, at least, many substances labeled as nonevaporable are carried along with steam. This is well exemplified in the necessity for triple distillation of distilled water for certain highly technical purposes.

The two substances specified in the query are chemically highly dissimilar. "Corrodicide" primarily is intended for use in hot or cold water supply systems and not in boilers. The formula for this inhibitor is not fixed but is based on the analysis of the particular water to be treated. The formula commonly includes trisodium phosphate, disodium phosphate, sodium carbonate and sodium silicate. None of these substances are toxic in small quantities. However, its manufacturers produce and market another inhibitor, named "Corrodine," which is a volatile liquid and which might reach pressure cookers. This material is introduced into boilers but is not specified by the manufacturer for use when steam comes in contact with food-stuffs.

"Coraval," a volatile substance and intended for the lines of the system only, represents one or more amines. The nature of the application of "Coraval" is such that, in small quantities, foods in pressure cookers directly connected with boilers making use of this inhibitor and persons in such steamy atmospheres may be in the presence of traces of this amine or these amines. It is probable that due safeguards already have been provided. Any foods cooked in the presence of abnormal quantities of this amine would not be sapid nor would water be potable. Moreover, the quantity requisite to adequate anticorrosion purposes is so low that any quantity escaping into a pressure cooker or into the atmosphere under normal operating conditions would be so low that injurious effects would be unlikely. In short, when dangerous quantities might be present, odor and taste would serve as warnings. Not all amines possess offensive odors, as is well attested through common experience of users of many brands of brushless shaving creams, which substances contain amines. On the other hand, the highly offensive odors of decomposing fish are partly due to the putrefactive formation of trimethylamine. Some amines also are skin irritants, such as the well known paraphenylenediamine, the much used photosensitive fur dye.

It appears that "Corrodicide" is not sponsored by its manufacturers for steam systems and therefore when properly used may be ruled out as a source of prospective injury under the circumstances of the inquiry. "Coraval," an amine or mixture of amines, is a caustic skin irritant in high concentration and a convulsive poison after hypodermic introduction in such quantities as 0.5 Gm. per kilogram of body weight. It appears to be lacking in dangerous properties when administered by mouth in dilution in such doses as 100 mg. per kilogram of body weight daily. Such quantities under normal usage of "Coraval" are unlikely to reach food or food workers. Moreover, any accidental major exposures probably would be accompanied by disturbing odors and tastes.

Both of the manufacturers concerned cooperated in furnishing information conducive to the proper appraisal of this problem.

EXERCISES FOR RELIEF OF DYSMENORRHEA

To the Editor:—There have been recent reports of the large scale use of the so-called Billig exercise for dysmenorrhea and of the extremely favorable results of its practice at the University of California, in the Los Angeles City School System, in the Consolidated Vultee Aircraft Corporation and elsewhere. A report in the September 1943 issue of *Industrial Medicine* by A. C. Dick and others gives the following explanation regarding the exercise: "Treatment is based on the discovery that in women with dysmenorrhea there is a postural defect of contracted fascial ligamentous bands restricting posterior tilt excursion range of the pelvis in relation to the legs and back. At menstruation (with the change in ovarian hormone level) the ligaments further shorten, causing impingement with irritation of the peripheral spinal nerves passing through and by them. The nerves usually irritated are one or more of the following: 11th dorsal, 12th dorsal, 1st lumbar and their branches, the ilioinguinal and iliohypogastric. The impingement gives rise to symptoms of pain in the low back in the region of irritation or in the region of distribution of these nerves in the lower abdominal wall and groin, or both. Factors influencing the contracture of the ligaments are varied. Treatment consists in freeing the nerves of their impingement by correcting the postural defect. This is done through precise ligamentous stretching exercises carried out by the patient routinely to progressively, accumulatively lengthening the ligaments involved." The Harlan Shoemaker Fund for Paralytics furnishes a 16 mm. film of the exercise and is apparently sponsoring similar exercises for other painful conditions. Is the explanation offered of the mechanics of menstrual pain and its alleviation by exercise physiologically acceptable? Is there any corroborating evidence of the value of such an exercise?

M.D., New York.

ANSWER.—It has not been proved that in all or most women with primary dysmenorrhea "there is a postural defect of contracted fascial ligamentous bands restricting posterior tilt excursion range of the fibers. . . ." Likewise there is no proof that at menstruation the ligaments further shorten, impinge and irritate the peripheral spinal nerves enumerated in the query. Furthermore, it has not been shown that there is any connection between impingement and irritation of the peripheral spinal nerves and dysmenorrhea. The part of the nervous system which is definitely associated with painful menstruation is the sympathetic nervous system, particularly the part usually referred to as the presacral nerves. The operation of presacral neurectomy has relieved the vast majority of patients with dysmenorrhea for whom it has been tried.

H. E. Billig Jr. (*Arch. Surg.* 46:611 [May] 1943) and A. C. Dick, H. E. Billig Jr. and H. N. Macey (*Indust. Med.* 12:588 [Sept.] 1943) claim excellent results in cases of dysmenorrhea from the use of the special exercises. During the first ten months of installation of the exercises 70,000 absentee hours were eliminated and there was an 80 per cent reduction in the use of menstrual cramps as an absentee excuse. Also 70,000 decreased efficiency hours were eliminated. Another favorable report was written by Esther Gilman (*J. Health & Phys. Educ.* 15:377 [Sept.] 1944). In view of the favorable results described, if there was not a large psychic factor involved, some other reason for the benefits must be sought than that given by the proponents.

LEUKOCYTE PICTURE IN MALARIA

To the Editor:—In this Carolina coast town, we have a certain amount of malaria, both acute and chronic. This summer, in the laboratory, we have obtained a series of blood counts like this: There is usually an increased total number of white cells, running about twelve or thirteen thousand; in the differential Schilling count, there is a high proportion of young cells, running as high as 30 per cent of the total number of polymorphonuclear cells counted; the overall total of the polymorphonuclear cells is little or not at all above the normal 70 per cent; there may be definite increase to around 30 to 40 per cent in the lymphocyte series. With this count we frequently find plasmodia. These patients usually have slight or definite fever and usually complain of dizziness and malaise, but they are not particularly toxic. They definitely are not as sick as one would expect from the pronounced shift to the left as seen in severe infections. Has this sort of blood count been noticed by other workers in the field of malaria diagnosis?

Joseph R. Latham, M.D., New Bern, N. C.

ANSWER.—The characteristic white blood cell picture in acute malaria consists in an increased total count during the actual onset, but as soon as the attack reaches its maximum, either clinically or by the appearance of an increased number of infected red blood cells, and thereafter to and during the quiescent interval until the next onset, the count decreases to normal or even to 5,000 or less. In chronic malaria there is usually a leukopenia, with a deficiency in the neutrophils. Almost invariably there is a monocytosis, with an increase in the number of monocytes and lymphocytes, and in acute infections there may be an appreciable number of wandering histiocytes.

American and British textbooks make no specific mention of the Schilling count, but Mühlens, Nauch, Vogel and Ruge (*Krankheiten und Hygiene der warmen Länder*, ed. 4, Leipzig, Georg Thieme, 1938, p. 82) state that during attacks there is a

shift to the left in the Schilling count, as observed by V. Schilling himself (1924), with the appearance of juvenile forms and metamyelocytes. Moreover, Böhm (1918), Newham and Duncan (1924) and Beregoff (1934) have also observed stab or band forms in severe infections; Winfield (1932) has reported a shift to immature stages proportional to the severity of the disease. Schilling found that even between attacks, when the neutrophils were greatly diminished, stab forms might still be present, indicating a severe drain on the granulocyte-forming tissues.

In severe infections both monocytes and mature neutrophils frequently have ingested malaria pigment and parasites of all stages. Owing to increased phagocytic activity of the large monocytes and a consequent increase in their production, the proportion of these cells to the total white cells may reach 30 per cent. In the absence of other diseases of the blood stream and blood-forming organs, a monocytosis of 15 to 20 per cent with an associated leukopenia is suggestive of malaria, while 8 per cent or less of large monocytes is presumptive evidence of freedom from malaria.

Although there is considerable difference in individual observations, the following changes in the white blood cell picture are characteristic of malaria: there is a relative and sometimes an absolute increase in the number of large monocytes. There may be a leukocytosis, particularly if the discharge of parasites from destroyed red blood corpuscles is heavy; but if the parasites are scant there may be no increment in the total number of white cells. Usually, but not invariably, the periods between attacks are characterized by leukopenia with monocytosis.

PENICILLIN FOR SCARLET FEVER

To the Editor:—A healthy white boy aged 6 years contracted fairly severe scarlet fever with rectal temperatures reaching 104 to 106 F. on the fourth day, pronounced asthenia and severe multiple synovitis. Since onset he had been given adequate doses of sulfadiazine and small doses of acetylsalicylic acid for the control of the fever and the arthralgias. The parents refused serum "because it harms the heart." On the fourth day after the appearance of the rash I decided to suspend all medication and injected 5,000 units of penicillin every three hours. At the second injection the fever started to diminish and the boy's temperature became normal the following day. But the most surprising effect was that on his joint pains; these seemed to disappear under the influence of the penicillin. I realize that care must be taken in order to avoid "post hoc ergo propter hoc" judgment. However, my understanding is that the temperature in scarlet fever does not return to normal by crisis but by lysis, and in this instance it returned by crisis. On the other hand I do not believe that the high fever could be attributed, even partly, to the sulfadiazine, because the patient kept on taking it during the fourth day, in spite of my order to stop it, and yet the temperature went down. Aside from some traces of albumin, the urine was normal all the time. The diagnosis of scarlet fever in this patient was established firmly. As far as I know, penicillin has not been used in scarlet fever so far.

Mardoqueo J. Solomon, M.D., Bronx, New York

ANSWER.—It is unusual for a scarlet fever patient to develop multiple synovitis as early as the fourth day of the disease. In the presence of such a complication one would be justified in prescribing sulfadiazine, which, however, is of little or no value for subduing the toxemia of scarlet fever. Although the dosage of sulfadiazine is not stated, it does not seem probable that this drug was responsible for the elevated temperature in the case discussed. Following the administration of scarlet fever antitoxin or human convalescent scarlet fever serum, the temperature commonly falls by crisis. At present, scarlet fever in general is exceptionally mild and has been so for the last few years. Possibly on that account penicillin has been somewhat neglected for this infection. However, penicillin has been given successfully for the treatment of complications of scarlet fever.

ROTARY NYSTAGMUS

To the Editor:—The reply to an inquiry about rotary nystagmus published in *The Journal*, Jan. 27, 1945, page 252, concerned a Negro woman aged 42 who had rotary nystagmus of uncertain duration, possibly about twenty-five years, and who had no other symptoms. The reply stated that rotary nystagmus may be congenital and that it occurs in defective vision and ocular muscle weakness. On the contrary, in these conditions the nystagmus is horizontal, not rotary. Rotary nystagmus does occur in acute conditions of the inner ear, as stated in the reply, but is of short duration and is accompanied by vertigo, conditions specifically eliminated in the query. Finally, the statement that rotary nystagmus is not a sign of organic disease of the central nervous system is questionable. It is an excellent sign of such disease. The isolated finding of rotary nystagmus probably indicates a small lesion in the vestibular or vestibulo-cerebellar tracts or their nuclei. In the absence of other findings one cannot say more. If old, it may be residual of a small inflammatory lesion. If recent, one might suspect the presence of a plaque of disseminated sclerosis.

A NONSUTURE METHOD OF BLOOD VESSEL ANASTOMOSIS

EXPERIMENTAL AND CLINICAL STUDY

ARTHUR H. BLAKEMORE, M.D.

AND

JERE W. LORD JR., M.D.

NEW YORK

In the early spring of 1942 we directed our efforts in search of a simple and yet efficient method of anastomosing damaged (severed) arteries adaptable to war use. An early start seemed timely. An opportunity would thus be afforded to indoctrinate those few basic principles in blood vessel surgery without which no technic of blood vessel anastomosis could possibly succeed when employed on a large scale, however simple in its execution.

The anatomic arrangement of collateral blood vessels in relation to main arteries in human extremities is such that war missiles causing damage to main arteries, of necessity, cause more or less damage to collateral vessels. There is, unfortunately, an anatomic limit to the number of collateral vessels that can be damaged and yet have a limb survive ligation of a damaged artery.

In this war, then, with effective treatment for shock, control of infection and vasospasm—adjuncts known to promote the blood carrying capacity of undamaged collaterals—a limb survives or dies following ligation of a damaged main artery in direct accordance with the number of collateral vessels remaining anatomically intact.

It is important to remember that successful restoration of blood flow by anastomosis is the one and only certain method of preventing the occurrence of anemic necrosis; collateral blood flow at its undamaged best can deliver but a small fraction of the minute volume blood flow that passes through a patent (anastomosed) main artery.

Extensive damage to collateral blood vessels was conceded to be an outstanding feature of the shrapnel extremity wounds of World War I. The great expansion of high explosive warfare in the form of land mines, grenades, fragmentation shells, aerial bombs and rocket shells in this war made it seem likely that there would

be a preponderance of wounds characteristically destructive of collateral blood vessels.

In fact, before we had proceeded far in the European phase of World War II, British¹ and other reports² called our attention to both the very high incidence of high explosive wounds and the certainty with which gangrene followed ligation of damaged main arteries.

The control of infection and blood clotting³ assures the success of blood vessel anastomosis and hence the control of blood flow. The elimination of devitalized tissue by débridement, the control of infection and an adequate supply of blood constitute a basic triad on which successful salvage of wounded extremities with main artery damage depends. Restoration of a pulsating normal volume blood flow by anastomosis revitalizes damaged tissues. It is a fact that damaged, anemic tissues afford a peculiarly favorable medium for the development of gas bacilli. Likewise a diminished blood flow disposes to the development of bone infection and delays bone union and the healing of wounds in general.

A NONSUTURE METHOD OF BLOOD VESSEL ANASTOMOSIS⁴

Starting with the ancient method of restoring blood flow through severed arteries, of which there is none simpler than tying the cut ends of a vessel over the ends of a connecting cannula, we added the principle of lining the cannula with a vein graft.

1. Fairbank, H. H. T.; Gordon-Taylor, G. and Page, C. M. Emergency Amputations. War Med. 2: 147-153 (Jan.) 1942.

2. The percentage of cases in which gangrene followed ligation of damaged main arteries reported from the IXth Evacuation Hospital during the Tunisian campaign was 70 per cent average for all arteries, and not a single instance of salvage following ligation of a damaged popliteal artery. Gen. W. H. Ogilvie, chief consultant to the British forces throughout the African campaign, in a personal interview stated that, "in spite of the employment of sympathetic nerve block and other adjuncts, the incidence of gangrene following ligation of damaged main arteries was far higher than that reported by Sir George Makins for World War I." He likewise stated that there had not been a single instance of salvage following ligation of a damaged popliteal artery. A war experience commentary of these statistics was revealed to Dr. Allen O. Whipple during a tour of the North African front in September 1943. Dr. Whipple recorded 8 cases with popliteal artery damage in which the leg was saved in only 1.

3. Murray (Heparin in the Surgical Treatment of Blood Vessels. Arch Surg. 10: 307-325 [Feb.] 1940) demonstrated that the efficiency of Carrel suture anastomosis in clean wounds is boosted from 35 per cent to 100 per cent by the continuous administration of heparin for a few days by intravenous drip. The credit for making the use of heparin practical under war conditions, however, must go to Dr. Leo Loewe and his associates (Loewe, L.; Rosenblatt, P., and Lederer, M.: A New Method of Administering Heparin, Proc. Soc. Exper. Biol. & Med. 50: 53 [May] 1942). These investigators have proved that safe, continuous heparinization may be maintained for weeks at a time following the subcutaneous deposit, at forty eight hour intervals, of heparin in Pitkin's menstruum. The latter permits a more even release of heparin than is practical to attain by the intravenous drip method. Hence, with the standardization of dosage, it is now practical to administer safe, automatically controlled, surgical heparinization in cases of wounds of the extremities at the field hospitals near the battle front without even the necessity of doing a blood clotting time.

Read before the Surgical Section of the Academy of Medicine, New York, Dec. 1, 1944.

From the Departments of Surgery, Presbyterian Hospital, Columbia University College of Physicians and Surgeons, and the New York Hospital, Cornell University Medical College.

Owing to lack of space, this article is abbreviated in THE JOURNAL by shortened case reports and omission of measures contributing to the success of the method. The complete article appears in the authors' reprints.

Most of the experimental work described in this paper was done under a contract, recommended by the Committee on Medical Research, between the Office of Scientific Research and Development and the Cornell Medical College.

It is of interest that paraffin coated cannulas were used, on occasion, by Professor Tuffier⁵ in World War I, and not entirely without success in spite of the absence of modern chemotherapeutic control of infection and blood clotting.

We selected vitallium, an alloy,⁶ as a suitable material from which to make cannulas or tubes. This metal may be left in tissues for indefinite periods without causing objectionable irritation. To facilitate bridging arterial defects of any length we recommend an identical technic employing a vitallium tube on each end of the vein graft.

silk placed behind the tying ridges. To prevent blood from passing between the vein and artery intimas a fine silk ligature is tied, just snug, 1 or 2 mm. from the end.

The method affords a broad vein intima to artery intima contact for healing. The holding ligature is well away from the flowing blood. In the presence of bacterial contamination this type of junction would seem to offer an advantage over the suture junction in that in the latter the vessel wall encompassed in the suture line, and thereby somewhat strangulated, lies in direct contact with the flowing blood. The joint is leak proof in the presence of anticoagulant therapy.

Fig. 1.—Operative technic of nonsuture method. 1. Cannula and tubes (for use in single or double tube technics). 2. Removal of vein graft; note that the branch is tied close to the vein with fine silk before clamping. 3. Irrigation of vein graft with isotonic solution of sodium chloride. 4. Method of triangulating end of vein with mosquito clamps. 5. Cuffing and securing the distal end of the vein graft to which a small amount of heparin may be added if desired. 6. Double tube technic with the vein graft mounted. 7. Introducing the distal end of the vein graft everted end of vein on the vitallium tube. 8. Tying fine silk ligatures just snug to prevent blood from penetrating between the vein and the artery intimas. Also releasing the proximal rubber shod clamp first to facilitate the passage distalward of any residual air bubbles mounted on a vitallium tube into the proximal end of the artery. 9. Completed anastomosis: the perivascular tissues are closed snugly around the anastomosed artery when possible. 10. A convenient way of preserving, hermetically sealed in an ordinary test tube, a vein graft for quick freezing. The graft is moistened with isotonic solution of sodium chloride, one end mounted on a vitallium tube in the usual manner; the other end is passed through a second tube and brought over the first tube to protect the intima until used. A wire serves to suspend the graft.

Figure 1 illustrates the technic. The ends of the vein graft are everted (cuffed) over the ends of the cannula or tubes and secured by fine silk ligatures placed behind tying ridges 4 or more millimeters from the ends of the cannula or tubes. The cut ends of the artery are then brought over the vein covered ends of the cannula or tubes and secured by ligatures of heavy

But, on the other hand, because of blood to intima contact only, the anastomosis affords little or no stimulus to thrombus initiation when the blood clotting time is normal.

Experiments.—Employing no anticoagulants, silk technic throughout, the small femoral arteries of dogs were selected for testing the efficiency of the nonsuture method for the following reasons: 1. Abundance of experience has shown that suture anastomosis of the femoral arteries of dogs, with or without the use of vein grafts, fails as often as it succeeds even

6. The approximate composition of vitallium is cobalt 65 per cent, chromium 30 per cent and molybdenum 5 per cent. The tubes were supplied by the Austenal Laboratories, Inc., of Chicago and New York.

when undertaken by skilled operators employing rigid aseptic precautions, whereas the same technic may be employed to anastomose the aorta or carotid with fairly regular success.

2. A review of the literature on the subject of methods employing a nonsuture prosthesis for the anastomosis of blood vessels reveals not a single instance of success in bridging defects of the femoral artery in dogs, using vein grafts.

With careful attention to details of technic, asepsis and the use of a generous segment of femoral vein from the opposite leg, our nonsuture method affords a 90 per cent expectance of success in bridging defects of the small femoral arteries of dogs and without the use of anticoagulants.

We have explored anastomoses of the small femoral arteries of dogs up to sixty-nine days and found them patent. Figure 2 is a photomicrograph of the artery vein junction following removal of the cannula in a single tube vein graft anastomosis patent thirty-five days after operation. Note the excellent healing at the artery vein junction. The vein graft appeared healthy and well nourished throughout. This is of interest in that the vein graft, in the single tube technic, lies within the vitallium cannula entirely isolated from the perivascular tissues.

As would be expected with larger vessels, the method was used to anastomose the abdominal aortas of dogs, using external jugular vein grafts and the two tube technic, with regular success. Three animals were observed for a period of eight months. On exploration the anastomoses were patent and the vein grafts were not dilated. The walls were somewhat thickened and had every appearance of being healthy.

ANASTOMOSIS OF BLOOD VESSELS IN CONTAMINATED WOUNDS

Because of widespread bacterial contamination of vascular injuries in the war wounded, it seemed important to study the efficiency of the nonsuture method using the double tube technic in contaminated wounds in comparison with the Carrel suture method of anastomosing arteries.

Method.—Delayed anastomoses of femoral arteries were made through dirty, open wounds, in dogs, six and twenty-four hours after unsterile ligation and section. The arterial defects were bridged with free femoral vein transplants. No anticoagulants were employed.

The study embraced five series of animals, affording an observation on ten or twenty anastomoses per series. Sulfanilamide 1.5 Gm. was placed in alternate wounds throughout. Sulfathiazole 1 Gm. was given by mouth twice daily to dogs in two series: one Carrel suture and one nonsuture series. Irrigation of the wounds with saline solution was carried out in one Carrel suture and one nonsuture series, whereas in the remaining three series careful débridement of the wounds was carried out at the time the anastomoses were performed.

Results.—The success of the Carrel suture technic was boosted from 10 per cent to 40 per cent by the performance of débridement and the use of sulfonamides. In general, however, the study confirms what has long been known; namely, the low efficiency of the suture method of anastomosing blood vessels in contaminated wounds. Cultures taken at the sites of failure (thrombus, site of secondary hemorrhage and aneurysm) invariably revealed bacterial growth.

The interesting results, using the double tube, nonsuture method in twenty-four hour delayed anastomosis of femoral arteries in contaminated wounds invited analysis and comparison with the entire group. In

the first place, anastomosis of arteries in contaminated wounds offers a sensitive index of the bacterial status and the relative efficacy of measures for the control of infection. For example, comparing results of anastomoses in the six hour contaminated wounds with the twenty-four hour wounds of beginning bacterial invasion, a "fall off" of 25 per cent successes occurred in the latter in spite of débridement of the twenty-four hour wounds versus simple irrigation in the six hour wounds. In respect to débridement, however, of the thirteen delayed anastomoses receiving sulfanilamide locally, but without débridement, there were thirteen failures (100 per cent), whereas in twenty-four hour delayed nonsuture anastomoses success followed débridement alone in 30 per cent of the cases. On the other hand, the 30 per cent successes with débridement alone was boosted to 60 per cent successes by the oral administration of sulfathiazole and finally to 85 per cent successes with the addition of sulfanilamide in the wounds. These findings are in accord with war experience to date; namely, that débridement greatly enhances the effectiveness of the sulfonamides in contaminated wounds.

Fig. 2.—Section of specimen removed from animal 1880, showing the junction of the artery and the vein. This junction has been bridged by intima.

It was of interest to observe in these delayed anastomoses in contaminated wounds that secondary hemorrhage occurred only once following the nonsuture technic, and this in a twenty-four hour wound without the use of the sulfonamides. We have never observed an aneurysm either at the artery-vein junction or in the vein graft.

Injuries to arteries in the war wounded are likely to be extensive, and further sacrifice of the vessel is necessary in débridement. For these reasons a method of blood vessel anastomosis, to be successful and practical for war use, must be easily adaptable to the use of vein grafts, and of any length. Our method fulfils this requirement admirably and, unlike suture anastomosis, a considerable disproportion in size between the graft and artery complicates the technic and efficiency of the method not at all.⁷ The majority of the wounded

7. Mann (Mann, F. C.; Herrick, J. T.; Essex, H. E. and Blades, E. J.: Effect on Blood Flow of Decreasing Lumen of Blood Vessels, *Surgery* 4: 249-252 [Aug.] 1938) has shown that the lumen of an artery may be narrowed 50 per cent without affecting the volume of blood flow through the vessel. The cross section area of an artery may be cut down 90 per cent and yet the vessel deliver 70 per cent of the total volume blood flow.

soldiers will have veins intact suitable for use as grafts; e. g., cephalic vein for anastomosis of the companionate arteries; external jugular, great saphenous and femoral veins for anastomosis of other arteries. These veins may be removed quickly (twenty to thirty minutes) for use as transplants to bridge arterial defects.

Fig 3—Appearance of 2 dogs, 2110 (twelve days) and 2092 (twenty one days) postoperatively, in which the right hind leg was amputated at the midthigh level and reimplanted after having been kept in cracked ice for twenty four hours. Moderate edema is still present in the twelve day animal.

HETEROPLASTIC VEIN GRAFTS

By heteroplastic we mean a vein graft transplanted from one subject to another.

At the suggestion of Dr. Rudolph Matas we have thoroughly investigated the usefulness of heteroplastic vein grafts and means of preserving them. In the first place we have satisfied ourselves beyond doubt that if an anastomosed main artery can be kept patent in a soldier beyond the period of post-traumatic edema up to fourteen days the extremity will be saved. By that time collateral vessels will have developed sufficiently to avoid the occurrence of gangrene. There is an abundance of evidence, clinical⁸ and experimental,⁹ in support of this.

To gain information on whether heteroplastic veins will function adequately to prevent gangrene when used to bridge arterial defects, the following experiments were performed: Figure 3 is a photograph of 2 dogs in which the right hind leg was amputated at the midthigh level. After an interval of twenty-four hours the legs were reimplanted, the nonsuture two tube technic being used and vein grafts from a third and fourth animal to bridge the defects in the femoral artery and vein. The amputated limbs were preserved during the twenty-four hour interval in cracked ice. The dogs were given sulfathiazole 1 Gm. twice daily by mouth from the time of the first operation. The photographs were made twelve and twenty-one days respectively after reimplantation of the limbs, and there is every evidence of a good supply of arterial blood in these reimplanted legs. Correlation of these experiments with the infor-

mative studies of Brooks and Duncan on the effects of temperature on the survival of totally anemic tissue is of interest.

The survival of the legs in these 2 dogs depended solely on the function of vein segments transplanted from other dogs, and in this sense the experiments are critical. However, we have used heteroplastic vein grafts to bridge femoral artery defects in 10 additional dogs. The anastomosis functioned for twenty-seven days (average), which is well beyond the postulated fourteen days of post-traumatic edema.

Figure 4 shows a photograph of a dog's aorta in which a defect has been bridged with a segment of human saphenous vein by the nonsuture method, using two 7 mm. vitallium tubes. The photograph was taken at exploration nineteen days after the anastomosis was performed. Pulsation in the femoral arteries had remained excellent. The vein graft was patent and without evidence of beginning thrombus formation. Likewise there was no evidence in its gross appearance to indicate beginning resorption.

THE PRESERVATION OF VEIN GRAFTS

We all concede that a method of preserving veins for the purpose of functioning successfully when used subsequently as grafts to bridge blood vessel defects must meet some rigid requirements. Not only must the intima be preserved in a state of normalcy to prevent thrombus initiation at the first onrush of blood at the completion of the anastomosis but the mechanism must be intact for the immediate resumption of physiology to maintain a continued normalcy of the intima. And, finally, the method must take care of a varying degree of bacterial contamination of the veins at the time of their removal. (Veins removed according to the usual aseptic technic will reveal bacterial growth on culture in 3 out of 4 instances.)

We have found that veins quick frozen in an alcohol-solidified carbon dioxide mixture and kept in the frozen state function adequately when used as heteroplastic grafts to bridge arterial defects, and without the use of anticoagulants. As a matter of fact, the segment of human saphenous vein used to bridge a defect in the dog's aorta (fig. 4) was kept for twenty-four hours

Fig 4—Appearance of a dog's aorta nineteen days after operation in which a defect has been bridged with a segment of human saphenous vein by the nonsuture method using two 7 mm. vitallium tubes. Vein graft can be seen between the exposed funnel ends of the tubes.

8. Matas, R., in Keen, W. W.: *Surgery: Its Principles and Practice*, Philadelphia, W. B. Saunders Company, 1921, supp. vol. 7, chap. 24, pp. 737-819.

9. Reichert (The Importance of Circulatory Balance in the Survival of Replanted Limbs, *Bull. Johns Hopkins Hosp.* 49: 86-93 [Aug.] 1931) of Replanted Limbs, except bone, large nerves, femoral artery and resected (cutting all tissues except the soft parts of the hind legs of dogs vein) and replanted by suture the soft parts of the hind legs of dogs and showed that arteries developed across the replant line on the third and fourth postoperative day. Veins and lymphatics regenerated on the fourth and fifth days. He likewise proved that the regenerated vessels were functionally adequate on the eighth postoperative day by ligation of the femoral artery and vein without the occurrence of gangrene. However, if the artery itself is ligated alone, gangrene of the leg cannot be prevented until the fourteenth day.

in the ice box and then quick frozen and preserved for three weeks before using. Veins may be kept frozen apparently for indefinite periods; e. g., on Sept. 8, 1943 defects in the right and left femoral arteries of dog 223 were bridged with segments of femoral veins from dog 2219, preserved quick frozen since June 16, 1943 (near-ly

three months). The nonsuture method of anastomosis was employed, using two 3 mm. vitallium tubes with each artery and without the use of anticoagulants. On September 22 (two weeks after the anastomoses had been performed) both vein segments were exposed and proved patent. The wounds were left open to heal by granulation. On October 16 (thirty-eight days after the anastomoses had been performed) the wounds were reexplored. The vein grafts were patent and the anastomoses functioning. There was no evidence in gross appearance of beginning resorption of the heteroplastic grafts.

Illustration 10 in figure 1 shows a convenient way of preserving a vein graft quick frozen for emergency use; e. g., to bridge a defect in the carotid artery should beginning evidence of cerebral damage supervene. Note that one end of the vein graft is already cuffed on one vitallium tube with the other brought over it to protect the intima. Care should be exercised not to exceed physiologic tension in selecting the length of the graft used to bridge a given arterial defect, and, of equal importance, redundancy should be avoided.

Repeated demonstrations have revealed that, with ready mounted vein grafts at hand, completion of an anastomosis may be routinely accomplished within fifteen minutes by the average operator.

We present 2 cases to illustrate the application of the nonsuture method of blood vessel anastomosis in the treatment of acute traumatic extremity wounds with main artery damage:

CASE 1.—History.—M. E., a boy aged 7 years, admitted to the Presbyterian Hospital July 20, 1943 in shock because of hemorrhage from a severed brachial artery, had had his left arm pushed through a glass door while at play. He received an irregular laceration across the inner aspect of the middle section of the arm. The brachial artery and the median and ulnar nerves were severed. The patient was promptly given 500 cc. of blood, 300 cc. of isotonic solution of sodium chloride and 2 Gm. of sodium sulfadiazine intravenously.

Operation.—Five hours after injury, with ether anesthesia, a pneumatic tourniquet was applied well above the wound. The skin was carefully prepared and the wound thoroughly irrigated with saline solution. The retracted ends of the severed brachial artery were freed for a distance of 5 to 6 cm. The tourniquet was released sufficiently to flush out severed vessels. Rubber shod clamps were quickly applied to the ends of the severed artery and the latter irrigated with saline solution. The cut ends of the brachial vein were transected with C Deknatel silk. As débridement proceeded, the smaller vessels were ligated with B Deknatel silk.

At this point of the operation the team was divided. This enabled one section to proceed with repair of the nerves, using arterial silk, while the other proceeded with preparation of a vein graft for bridging the arterial defect. Accordingly, the left femoral vein was isolated for a distance of 10 cm. distal to the origin of the profunda. The defect in the brachial artery was bridged by means of the segment of femoral vein mounted on two vitallium tubes 2 mm. in diameter. Just before removal of the rubber shod clamps 15 mg. of heparin (1.5 cc. of aquaemin) was injected into the artery just proximal to the anastomosis.

A pink color of the boy's hand resulted immediately after re-establishment of blood flow and only a few minutes elapsed before the left hand was as warm as the right. The muscles, fascia and skin were approximated with fine silk. The patient received 300 cc. of blood during the operation and left the table in excellent condition. The arm was placed in a plaster splint with the hand in volar flexion.

Postoperative Course.—The wound healed by first intention. The patient was discharged on the eleventh postoperative day

in a constant tension splint to permit exercise of unopposed extensor muscles, but protecting the paralyzed flexor muscles of the forearm against overstretching. Sulfadiazine therapy was continued through the fifth postoperative day. We cannot say that postoperative heparinization was adequate (its administration by continuous intravenous drip was discontinued after sixty hours) because the clotting time (capillary method) varied

Fig. 5.—Arteriogram of the anastomosed brachial artery in case 1 one month after operation. Whereas the funneled ends of the vitallium tubes are close together, a column of diodrast may be noted passing through the intervening vein graft. Compare the long tubes as used in this case with the shorter tubes of recent design shown in the inset.

from three to six minutes. Daily observations of the left radial pulse revealed it unchanged in volume.

Follow-Up.—One month later the patient was receiving physical therapy. The left radial pulse remained good. An arteriogram (fig. 5) confirmed the patency of the anastomosis. However, thrombosis of the anastomosis took place immediately following the injection of diodrast.

After five months chronaxia studies revealed innervation of the forearm muscles supplied by the median nerve.

After fourteen months complete sensory and motor recovery of the median and ulnar nerves had occurred. However, there was yet some inability to extend the fingers completely as the result of weakness of the interosseus muscles, though chronaxia studies revealed complete regeneration.

After seventeen months function had completely returned.

CASE 2.—History.—R. J., a colored boy aged 15 years, entered the Presbyterian Hospital July 7, 1944 with a severe laceration of his left arm. He incurred the injury falling through a plate glass cellar window. A tourniquet was promptly applied. After his arrival at the hospital, some hours later, a pneumatic tourniquet was applied, and deflated at one-half hour intervals. Family and past history was noncontributory. Physical examination revealed temperature 101 F., pulse 132, blood pressure 160/80. The boy was well developed and was apprehensive but not in shock. Examination of the left arm revealed a transverse laceration starting in the midbiceps region, directed obliquely downward, dividing all soft parts to the bone and entering the elbow joints anteriorly. The laceration involved approximately two thirds of the circumference of the arm. The radial and median nerves were severed, as were the brachial artery and accompanying veins. As a result of muscle retraction the wound gaped widely. The forearm and hand remained cold, pale and pulseless following release of the tourniquet (fig. 6 A and B).

Operation and Result.—This consisted of irrigation and débridement of the wound, with suture of the radial and median nerves. The brachial artery defect was bridged with a segment of saphenous vein by the nonsuture technic, with a 4 mm. vitallium tube on each end. An excellent radial pulse was felt on releasing the brachial artery to blood flow. The postopera-

tive course was stormy, and great swelling of the entire arm occurred but subsided after ten days. The wound healed by first intention and an arteriogram carried out on the thirty-fourth postoperative day confirmed the patency of the anastomosis (fig. 7).

Follow-Up.—After four months the radial pulse remained excellent. Chronaxia studies revealed no innervation of the

Fig. 6.—Lateral (A) and anterior (B) views of wound in case 2.

forearm muscles as yet. Muscles supplied by the tourniquet damaged ulnar responded to direct stimulation, whereas there was no response from those supplied by the sutured radial and median nerves. Furthermore, the latter muscles were more wasted and fibrotic.

At seven months beginning nerve regeneration was taking place below the elbow. The radial pulses remained equal.

The similarity of these wounds to war wounds was as follows:

1. Damage to collateral vessels was extensive because of the location and scope of the wounds.
2. They were contaminated wounds with delayed treatment: Time elapsed from injury to restoration of blood flow in case 1 was eight hours, in case 2 eight hours.

It seemed highly probable that the extensive destruction of collateral vessels precluded saving the arm without performing an anastomosis in case 1, and certainly gangrene was avoided by restoration of blood flow in case 2. Under the favorable egis of débridement and sulfadiazine in case 1 and, in addition, penicillin in case 2, primary healing followed primary closure of the wounds.

It is of interest to note that the great saphenous vein was too small to use as a graft in the brachial artery of the 7 year old boy (case 1), but the diameter was exactly right in the 14 year old boy (case 2).

The vitallium tubes used in case 1 were smaller than any ever used by us in anastomosing vessels in experimental animals; furthermore, the administration of heparin in this case was inadequate both as to quantity and as to duration. In spite of these handicaps, a radial pulse of constant volume was maintained in the arm until thrombosis of the anastomosis suddenly occurred following the injection of 35 per cent diodrast for arteriography one month after operation.

Case 2 well illustrates the viciousness of prolonged tourniqueting: nerve paralysis (ulnar), tourniquet

shock and ischemic muscle changes. But it is of extreme interest that the latter was found only in the muscles supplied by the nerves that had been severed.

In the handling of wounded extremities with main artery damage the following routine is recommended:

1. Immediate control of hemorrhage: If a tourniquet is necessary, as it probably will be, it should be broad and well padded. A blood pressure cuff is ideal because of the ease with which it can be inflated and released at half hour intervals.

- 2 Treatment for shock: Whole blood transfusions are ideal in these cases because of promoting the maximum oxygen carrying capacity of the circulating blood.

3. Control of pain and vasospasm: Papaverine hydrochloride 1 grain (0.06 Gm.) given intravenously and followed at two hour intervals with $\frac{1}{2}$ grain (0.03 Gm.) hypodermically is the best single drug for this dual purpose.

4. Chemotherapy: Penicillin is undoubtedly the preferable agent in these cases. From 30,000 to 50,000 units should be given intramuscularly, to be followed by injections of 20,000 to 25,000 units at three hour intervals. Second best is the sulfonamides, but a high blood level should be attained as rapidly as possible. The patient should, of course, be protected against tetanus.

5. Preservation of a lowered temperature in the wounded extremity: It is now recognized that the maintenance of a lowered temperature reduces the metabolic rate in anemic tissues and is an important factor

Fig. 7.—Arteriogram in case 2 thirty-four days after operation. The patent saphenous vein graft is about the same size as the anastomosed brachial artery. The slight bulge of the upper end of the graft marks a valve site in the vein graft.

in delaying the onset of irreversible changes. It is usually not difficult to attain the right degree of chilling. It is well to remember that a totally anemic extremity will quickly assume the temperature of the surrounding air. If the latter is below freezing, of course the limb must be covered sufficiently. If, on the other hand,

the surrounding air is above 50 or 60 F. the limb may be chilled by swathing it in moist¹⁰ bandages and directing on it a current of air during transport or by an electric fan. And, finally, ice bags may be used, but guardedly, say one half hour on and one quarter hour off.

6. Position of limb: When at rest or in transport, the limb should be placed at rest in a position 4 to 6 inches below the heart level. This elevates venous pressure in the extremity just enough to keep what little blood that may arrive via collaterals sufficiently long for complete deoxygenization.

When the patient arrives at the installation where it is feasible to replace the tourniquet by surgical hemostasis, it is suggested that the operator should explore the wound and first secure the proximal stump of the severed main artery by ligature, securing in due course bleeding vessels as they are encountered. The distal end of the severed main artery should be washed free of clot with saline solution and the briskness of bleeding, if any, noted. Finally, 20 to 30 cc. of saline solution to which has been added 10 mg. of heparin (1 cc. of liquaemin) and 50,000 units of penicillin should be injected into the distal artery stump followed by its ligation. At this point of the procedure, if conditions do not favor proceeding with débridement or the restoration of blood flow by anastomosis (should the latter seem indicated), hemostasis may be completed and gauze placed loosely in the wound.

Penicillin 50,000 units, if not previously administered, should be given intramuscularly and continued thereafter, at three hour intervals, in adequate dosages. An adequate dose (150-200 mg.) of heparin in Pitkin's menstruum¹¹ should be deposited subcutaneously in the lateral aspect of the thigh. Papaverine hydrochloride should be continued subcutaneously, in half grain doses at two hour intervals until the patient reaches the installation with facilities necessary for definitive care, e. g., sympathetic nerve block, débridement and anastomosis.

Irrigation of the distal vascular tree with saline solution containing penicillin and heparin washes out contaminated thrombi from damaged veins, places penicillin in adequate concentration in those tissues in which, because of damage to blood supply, resistance to infection is lowest. Though some of the heparin and penicillin is washed out into the wound, the heparin which remains in those parts of the vascular tree where stasis exists prevents thrombosis until complete systemic heparinization supervenes, a matter of two hours following the subcutaneous deposit of heparin in Pitkin's menstruum. Then, for a period of forty-eight hours, it can be counted on that each collateral vessel anatomically intact will remain patent and the distal vascular tree free of thrombus. This insures, on the one hand, success with subsequent sympathetic nerve block in cases in which there are an adequate number of collaterals functionally intact and for others a patent vascular tree ready for the reception of a restored pulsating, normal volume blood flow by anastomosis.

There is excellent evidence, both experimental and clinical, in support of the opinion that if the foregoing measures are carried out, with careful attention to detail, the expectancy of salvage following restoration of blood flow by anastomosis may extend from twenty-four to forty-eight or more hours after injury—time to cover a lot of distance in this mobile era.

(To be continued)

ABDOMINAL PAIN IN CHILDREN

JOSEPH BRENNEMANN, M.D.

READING, VT.

There is probably no more interesting, uncertain or hazardous clinical domain in childhood than acute conditions in the abdomen and pain is the presenting symptom, the warning signal, that something has gone wrong and that it may be serious. That it is not usually so has in itself an element of danger. The very fact that the incidence of conditions that are not serious is much higher than that of those that are may lead to a lack of wariness that may be fateful. The differentiation cannot be made safely on the telephone. The difficulty in diagnosis is not due to the fact that the infant cannot talk and the older child may not be able to give an intelligent account of his symptoms. The pediatrician is as much at home with the youngest child as he is with the oldest. The morbid anatomy of the child is distinctive and relatively limited; his signs and symptoms are true and dependable and are not swayed by aberrant emotions as they are more often in the adult.

Pain in the sense here used naturally includes tenderness, which is usually of greater diagnostic value in this connection than is spontaneous pain. For this and other reasons, palpation is the most revealing procedure in abdominal diagnosis.

The majority of the more serious abdominal conditions heralded and accompanied by pain fall into two main categories: those due to obstruction and those due to infection. Each of these presents its own characteristic signs and symptoms that vary only with the degree rather than the nature of the underlying condition.

When there is obstruction to any hollow viscus with a muscular propulsive mechanism there is intermittent pain, which may be very slight or very intense depending on the degree and suddenness of the obstruction. If it is sudden and complete, the pain is agonizing, especially at the start, and there may be shock. This is known as colic no matter what the underlying cause. There is very little tenderness. Pressure, indeed, is often a source of relief and is not infrequently self applied. If the obstruction is partial and gradual in onset, the pain varies with the degree of obstruction. It is always intermittent, it may be almost negligible, it may be severe. Hypertrophy, hyperperistalsis and distention, finally atony if too long continued, supervene proximal to the point of closure, and atrophy and contraction distal to it.

In conditions due to infection, the pain is more constant and uniform unless there is concurrent obstruction. Intermittent periods of greater pain will then manifest themselves. Tenderness is always present over the affected area and is more pronounced than unelicited pain.

THE OBSTRUCTIONS

In the child, the obstructions occur predominantly in the intestinal tract, and the pains and other symptoms and signs conform to what has just been said. Among the congenital intestinal obstructions are those due to atresia and stenosis, bands, eventration, fetal peritonitis, malrotation of the midgut and meconium

10. We have found that wetting the gauze with alcohol at half hour intervals is a simple method of chilling a limb.

11. Procured of Roche-Organon, Inc., Nutley, N. J.

Dr. Brennemann died July 2, 1944.

ileus, in which there is an almost irremovable rubbery mass of meconium throughout the intestinal tract due to a pancreatic deficiency.

PYLORIC STENOSIS

In pyloric stenosis there is a gradual and partial obstruction. There is therefore only slight pain, usually not enough to make the infant cry. There is only an obvious discomfort, as shown by the wrinkled brow, the look of apprehension and the stopping of nursing as each new episode occurs coincidental with the appearance of maximal peristaltic gastric waves and the approach of projectile vomiting.

THE COLIC OF INFANCY

The colic of infancy is in a class by itself. The very name in common usage everywhere suggests a pathogenesis identical in nature with that of other colics. The pain is agonizing; it is definitely intermittent. It comes on rather suddenly and usually ends as abruptly. Pressure is grateful as in other colics, as every mother knows. For some unexplained reason it tends to occur at about the same time each day, usually the late afternoon or early evening. The frequency with which it occurs only during the first few months of life has led to the term "three months colic" among the public, who often look on it, in legal phraseology, as an "act of God," something that cannot be avoided and must be accepted. It has been attributed to enterospasm, imbalance of the autonomic nervous system, a hypertonic or neuropathic constitution, hunger, overfeeding and even a "fatigue toxin" in the mother's milk. Since one cannot accept all of these explanations one need not accept any of them. Colic is a human condition; it does not occur among the young of our barnyard animals. The baby comes into the world far more underdone than these and it is probable that the intestinal tract shares in that handicap. Colic is as frequent in the breast fed as in the artificially fed infant; probably more so. With its content of around 7 per cent of lactose and nearly 4 per cent of fat, human milk has a high percentage of fermentable food elements. The distention by gas from this source may itself be a cause of severe pain and possibly of mechanical obstruction. It seems not unlikely too that acute obstruction may result from kinking or bending on itself of the overdistended intestine in the cramped space in which it lies. The relief that often comes from an enema or a spontaneous burst of flatus lends confirmation to an etiology of this nature. I have never encountered colic in an infant with pyloric stenosis where hunger must be at a maximum. Overfeeding may enter into the picture. The other explanations seem hazy and are not fully established therapeutically.

Babies often cry during, more often immediately after, nursing, obviously because of the combined pressure of food, gas and swallowed air and the inability of the stomach to push the milk through the pylorus fast enough. This is sometimes called by infant nurses the "up" as compared with the "down" variety of colic just discussed. The pain is often quite intense. It is relieved at once by holding the baby in the erect position and making pressure on his stomach, or more often by holding him snugly against the shoulder and patting his back. This is commonly referred to as "patting up the bubbles" or, more onomatopoeically, as "burping."

ACUTE INTESTINAL OBSTRUCTION

Intussusception is the most frequently occurring of acute intestinal obstruction. It is relatively rare; the first year of life and especially so after the second. The onset is dramatic. Awake or asleep the baby suddenly cries out with a pain that is obviously extreme. He screams, claws and clambers up on his motor twists and squirms, and nothing gives any relief until almost as suddenly, there is a lull with absence of pain only to be followed by a similar painful episode. The sudden onset is of great diagnostic value. As in almost no other condition the mother usually states the exact hour at which the pain began. In the course of several hours the pains become less severe, as a rule not enough to cause the child to cry out as before. With the recurrence he merely squirms, throws himself to one side, doubles up, whimpers, moans or sighs. His face usually becomes so distinctive that it too is of diagnostic value. He appears calm, too calm, paying little attention to his surroundings and yet seems preoccupied and apprehensive. Only twice can I recall having seen a child with an intussusception smile. This calm follows the storm, probably due to shock, is apt to mislead the mother, who naturally measures her child's illness by the degree of pain, as well as the doctor who has not seen or properly evaluated the onset. The blood in the stool, often only in a second one, brings about renewed interest. The sausage shaped tumor that is pathognomonic in this clinical setting, that may be found anywhere between the ileocecal valve and the rectum, that can nearly always be made out by palpation without an anesthetic, if one has patience, gentleness and a warm hand, is only slightly tender.

A rectal examination is always interesting for several reasons and may clinch the diagnosis. Whereas the normal infant nearly always screams with pain, the baby with an intussusception will, as a rule, pay no attention to the painful procedure. Again, the finger seems to fall into an empty cavity and as it is withdrawn it is followed in the great majority of cases by a small, silent spurt of a turbid currant jelly-like mixture of blood and mucus that too is pathognomonic of intussusception in the proper clinical setting. The examination may further be rewarded, though rarely, by finding the cervix-like mass with its central dimple.

If in any case of intussusception there is pure blood in any considerable quantity one must suspect that an ulcerated Meckel's diverticulum is involved in the process. Finally it must be borne in mind that very exceptionally there may be but little pain at any time or a great deal throughout the whole course of the illness.

Sudden and complete intestinal obstruction from any cause such as strangulated hernia, volvulus, paralytic ileus, congenital or acquired bands or Meckel's diverticulum may present much the same pain and other signs and symptoms that occur with intussusception except that there is no bleeding from the rectum and no sausage shaped tumor.

CHRONIC INTESTINAL OBSTRUCTION

The pain that occurs with chronic intestinal obstruction due to congenital bands or narrowing, to tumors, to postoperative adhesions and contractions and other like conditions may be negligible; it may be fairly severe, depending on the nature, the rate of development and the degree of obstruction. It is always intermittent. It occurs with each new contraction of the intestine.

proximal to the point of obstruction. It is in these chronic conditions—that intestinal patterning, exaggerated peristaltic movements and abdominal distention are the outstanding features, especially if the colon is involved. The diagnosis must be based on the whole clinical picture.

CONGENITAL ANORECTAL STRICTURE

Congenital anorectal stricture is not a rare condition; it presents a striking clinical picture and yet it is still commonly not recognized. The obstruction is due to an incomplete fusion of the descending mesenteron and the ascending proctodeum during fetal life with a resulting iris diaphragm, or sickle shaped, protrusion from the rectal wall into the lumen of the intestine at a point rarely more than a centimeter above the sphincter ani. If the obstruction is only moderate there will be relatively slight pain; there may be little or a great deal of distention and patterning if the condition is not relieved. The stricture, on the other hand, may be so tight that the smallest little finger cannot be inserted at one sitting without undue force and only a narrow ribbon-like, or slate pencil sized, stool can be passed with great effort. Even meconium and gas may not be passed for days. The abdomen may assume truly batrachian proportions and be covered with engorged veins. Under these more acute conditions the infant may scream with each new painful contraction. That the disease is not one of great rarity is evidenced by the fact that I have seen at least 25 cases. In every instance the child was completely cured by digital dilation, sometimes by one insertion, more often by inserting a larger finger each time over a period of days. In only 1 infant, though the stricture was fully dilated, abdominal distention persisted as the result of some cause that was not even cleared up by laparotomy. The surgeon is, naturally, rarely privileged to see this condition.

Similar signs and symptoms may be produced by redundant valvelike folds, or plications, of the mucosa higher up in the rectum. A boy about 6 years of age with a huge megacolon could be completely deflated with a hissing sound each time a proctoscope was easily passed just 4 inches.

OBSTRUCTION OTHER THAN INTESTINAL

Renal and gallstone colic I have never encountered in a child. Ureteral obstruction due to congenital narrowing of the ureter at the ureterovesical junction, or an aberrant artery crossing the ureter near the renal end, or a kinking of the ureter causes hypertrophy and dilatation of the ureter and kidney proximal to the obstruction, but this rarely leads to much pain; sharp pain may, however, occur with acute obstructions due to kinking. An acute painful obstruction due to plugging of a ureter with pus in so-called pyelitis is, in my experience, either extremely rare or else hard to recognize. Vesical neck obstruction leads to hypertrophy and dilatation of the bladder, ureters and kidneys and carries with it the intermittent pain and discomfort of an obviously chronically distended bladder.

Children will sometimes permit the bladder to become distended to a painful degree without any evidence of either a local or a central lesion. A little encouragement, a stern admonition, some running water, letting a bedridden girl sit up and a boy stand, will nearly always obviate the necessity of catheterization. A fairly

common condition is the very painful, acute distention of the bladder due to the pain on urination that goes with the ulcerated meatus that so often accompanies the ammoniacal night diaper of infancy. Sometimes the opening is nearly closed by a crust. Applying a drop of a cocaine solution to the meatus brings prompt relief to both the local pain and the painful distention of the bladder.

THE INFECTION APPENDICITIS

Appendicitis is the *bête noire* in abdominal diagnosis. Because an early and immediate diagnosis is always important and may be vital, every abdominal pain, every "stomach ache" calls for the exclusion or establishment of the diagnosis of that disease. The warning signal of abdominal pain can never be dismissed casually. While the diagnosis, based on the mode of onset with characteristic pain, tenderness and vomiting, the low fever and the usually significant leukocytosis, is often, probably usually, easy, it is by no means always so. After more than forty years of extensive and intensive experience and an interest in the subject second to none other, I can truthfully say that I still approached the acutely painful abdomen in a child with more apprehension and a greater feeling of uncertainty than any other domain in childhood. Even sadder is the fact that all this interest and experience did not make me feel that I had a very appreciable edge on my residents, whose experience was so much more limited. I think I might add, after due hesitation, that even the excellent surgeons with whom I was associated did not have a significantly higher batting average than did the rest of us. The surgeon has an advantage over us in that his experience is largely restricted to those cases that probably are, or are thought to be, appendicitis. He is at a disadvantage in that he does not see the far greater number of cases of abdominal pain that might be due to appendicitis but are not that the pediatrician and the general practitioner are called on to differentiate. These include nearly all other painful abdominal conditions, except those already discussed, and can therefore be taken up in the differential diagnosis of appendicitis.

The appendix is an insignificant little organ of serious import only because of its location in the peritoneal cavity. When inflamed it very rarely causes intense pain or more than a few degrees of fever. Only two or three times have I seen a child scream with pain. He may even then have had a low threshold with reference to pain. As in the adult, the pain commonly starts in the region of the umbilicus and after a variable period it shifts to some other part of the abdomen, usually to the right lower quadrant. The tenderness is always at the point of maximal involvement and is of far greater diagnostic value than the spontaneous pain. Early point tenderness is the single most important diagnostic sign. Later it becomes more diffuse. This point is most frequently somewhere around McBurney's point. It may, however, be higher or toward or in the right flank if the appendix is retrocecal or near Poupart's ligament on the right side or even to the left of the midline. We had at one time 2 children in whom the tenderness was definitely on the left side. One was a case of situs inversus; in the other child the appendix stretched across the midline and the tip was the most tender part. The child naturally protects himself voluntarily by tensing his abdominal muscles when he is palpated. Involun-

tary, boardlike rigidity occurs when peritonitis has set in. Rigidity is not an essential factor in the diagnosis of an uncomplicated appendicitis. Rebound tenderness is interesting but merely indicates that there is an intra-abdominal infection. It has never seemed to me that the very unpleasant, even painful, rectal examination often adds anything to the diagnosis in a child except when a pelvic abscess is suspected either before, but especially after, operation.

DIFFERENTIAL DIAGNOSIS AND OTHER CAUSES OF ABDOMINAL PAIN

The pain of a diaphragmatic pleurisy of a right lower lobe pneumonia may be referred to the right upper quadrant of the abdomen and simulate that of appendicitis. The pain is usually greater than the tenderness and higher in the abdomen. The clinical pictures in the two conditions, however, differ widely. If one is in doubt an x-ray film will nearly always settle the matter.

Carnet published a series of papers dealing with "intercostal neuralgia" as a source of error in the differential diagnosis of appendicitis. He maintained that if the abdominal wall was tensed by straining or by elevating the legs in the dorsal position the tenderness would disappear in appendicitis and remain in "intercostal neuralgia." I was not impressed until he showed me several cases, all, however, in adults. It is a difficult sign to elicit in children.

A beginning peritonitis due to perforation of an ulcer in Meckel's diverticulum can hardly be differentiated from appendicitis unless it is accompanied by a hemorrhage from the rectum.

Torsion of a right sided ovarian pedicle gives much the same type of pain and other symptoms as those of an inflamed appendix. A very high leukocyte count or the early finding of a small, hard, fairly tender mass high on the right side on rectal examination should make one suspicious of a twisted pedicle. The first premenstrual pain of an adolescent girl, even the intermenstrual mittelschmerz of a ruptured ovarian follicle on the right side may have to be considered. The abdominal pain of Henoch's purpura may lead to an error in diagnosis if the petechial hemorrhages have not as yet appeared in the skin, a possible occurrence. This is true also of the pain and tenderness of a right sided oophoritis or of an acute pancreatitis occurring with mumps, especially if the involvement of the salivary glands has not yet occurred or has not been recognized. A diverticulitis other than that of Meckel's diverticulum, which can hardly be differentiated from appendicitis, I have never recognized in a child. The pain and tenderness of subdiaphragmatic abscess, usually on the right side following appendicitis in children, develops slowly and is rarely severe—it may be nearly absent. It may be referred to the shoulder, more often to the right upper quadrant of the abdomen, due to diaphragmatic pleurisy, which is always present together with a pleural exudate. The x-ray may also show air in the abscess below the diaphragm or succussion may be elicited. In perinephric abscess there is dull pain and deep tenderness of gradual onset in the flank. The pain and tenderness of the onset of dysentery may be confusing if the characteristic diarrhea and tenesmus have not set in. The discomfort of a simple gastroenteritis is usually not localized and should not enter into the picture as often it does.

PARENTERAL INFECTIONS

A frequent cause of confusion in the differential diagnosis lies in the abdominal pains that occur with parenteral infections, most often with upper respiratory tract infections, possibly only because these are more frequent than all other infections combined. They occur not infrequently with acute rheumatic fever. One type of pain occurs early, is commonly restricted to the umbilicus, is sharp, intermittent, of variable intensity and suggests a referred pain from some undetermined source. There is little or no tenderness. Another pain occurs at any time during, or throughout, the parenteral infection, is more diffuse, of a duller character and there is more tenderness than spontaneous pain. This pain is rather obviously due to mesenteric lymphadenitis. This has been confirmed by both operation and necropsy. If the pain and tenderness are widespread or on both sides, the case is probably not one of appendicitis. Whether these two manifestations of pain have a common origin is not known. One can only speculate too as to whether this more widespread type of lymphadenitis has the same etiology as the mysterious, apparently more regional lymphatic involvement not so infrequently encountered at operation instead of a suspected appendicitis. I rather doubt it myself. It has been claimed that the differential diagnosis between appendicitis and lymphadenitis can readily be made by turning the patient for a short time on the left side and then determining the site of tenderness. If it remains on the right side it is said to be due to appendicitis; if it has shifted to the left, to lymphadenitis. I have not been able to confirm this sign in children, nor do I know how to differentiate the two conditions. It should be emphasized, although parenthetically, that the presence of an upper respiratory tract infection must never keep one from treating as appendicitis a condition that looks like appendicitis, since there is considerable evidence that more than half of all cases of appendicitis are causally related to throat infections.

PERITONITIS

In secondary peritonitis, usually due to appendicitis, there may be a lull in pain following rupture of the appendix, but this is soon followed by greater pain, exquisite tenderness and involuntary boardlike rigidity over the affected area. These are often more widespread than the local lesion would seem to indicate. It is then often hard to determine whether one has to deal with a spreading secondary peritonitis or a so-called primary peritonitis if one sees the child at an advanced stage of the disease unless there is a clearcut history of the pain and tenderness having started in the right lower quadrant or unless there is still more tenderness in that region than elsewhere. If there is a walled off local abscess, the pain and tenderness lessen gradually at first and after a time much more rapidly. Similar signs and symptoms follow the rupture of an intestine, the perforation of an ulcer or the suppuration and rupture of a lymphatic gland, fortunately a very rare occurrence.

In primary peritonitis the child appears from the start much sicker than with an uncomplicated appendicitis. Severe pain, mirrored in the drawn and tortured face, and exquisite tenderness and boardlike rigidity, appear rapidly over the whole abdomen with no definite localized starting point. It is, however, sometimes difficult to diagnose in a young infant, and now with the

use of the Wangenstein technic and the sulfonamides, which seem clearly indicated if a primary peritonitis is suspected, we are sometimes confronted with the anomalous situation of probably having cured a very serious illness without knowing whether it really existed. The pain, tenderness and other signs and symptoms are the same whether the peritonitis is due to a pneumococcus or to a hemolytic streptococcus, which seem about equally frequent as causal agents. Primary peritonitis is often preceded or accompanied by diarrhea, a very rare occurrence with appendicitis or secondary peritonitis.

Tuberculous peritonitis usually causes little more than a dull pain or discomfort unless there is obstruction due to narrowing of an intestine or extreme distention from fluid.

In conclusion, I can only say that the majority of abdominal pains encountered in private practice, which gives a truer picture of actual incidence than is found in hospital practice, have, in my experience, been of unknown nature and unknown etiology.

ABSTRACT OF DISCUSSION

DR. M. G. PETERMAN, Milwaukee: Abdominal pain is one of the most common symptoms in childhood. Children refer many of their complaints vaguely to the abdomen. Fortunately they vomit easily, especially after dietary excesses. The pain and vomiting must not be taken too seriously, since they usually tend to subside spontaneously if the children are left alone and allowed to rest. The greatest danger to the patient is the surgically minded colleague who focuses attention on the appendix. Acute appendicitis is a rare disease in childhood, but, unfortunately, appendectomy is paradoxically a common operation. I am amazed at the discrepancy between the number of abdominal surgical scars I see daily and the few cases of genuine acute appendicitis. I am just as much astounded at the rarity of leukocyte and differential counts and rectal examinations on children before operation. If a reasonable doubt exists as to the diagnosis of acute appendicitis, the appendix must be removed. However, that doubt cannot be reasonable until a leukocyte and differential count, a urinalysis and a rectal examination have been made. Surely there is always time for these harmless procedures before submitting a child to an abdominal exploration. The incidence of cases diagnosed as acute appendicitis at Milwaukee Children's Hospital in the last ten years was only 2 per cent of the total admissions. Many children with recurring abdominal pain are brought in to the office for diagnosis after appendectomy has failed to bring relief. The child with recurring abdominal pain demands a careful examination and a consideration of the possibility of gastrointestinal allergy and of subacute rheumatic fever. These two conditions often explain the obscure pains which may be associated with low fever and slight, if any, leukocytosis. Allergy causes pain by producing spasm of the intestinal tract and rheumatic fever, by infection. Much of the colic in infants is due to gastrointestinal allergy to foods, particularly when these are introduced too early. It is a common practice today to introduce new foods long before there is any need for them and long before the infant gastrointestinal tract is prepared for their digestion. Commercial advertising has exerted a pernicious influence on infant feeding in modern practice. Another cause of chronic or recurring abdominal pain emphasized long ago by Dr. Brennemann is that due to the infection or enlargement of retroperitoneal glands. In such possible cases tuberculin must be given and sedimentation rate tests made for diagnosis. Chronic constipation or incomplete evacuation of the rectum is a common cause of abdominal pain and can be easily remedied without surgery. I agree with Dr. Brennemann that the majority of abdominal pains in children are of unknown etiology, but I am sure that most of these disappear under conservative management.

DR. JOSEPH GOLOMB, New York: In differentiating diaphragmatic pleurisy or pneumonia from appendicitis Dr. Alexander Nicoll of Fordham Hospital has the apt saying "Too sick, too soon." This means too sick, too soon to be appendicitis. In differentiating a surgical from a nonsurgical condition of the abdomen Dr. Henry Roth of Lebanon Hospital has a helpful hint: "A child who is conscious and not forcibly held, who on deep abdominal palpation makes no attempt to remove your hand probably does not have a surgical condition of the abdomen. The converse is not true." Dr. Brennemann has described the severe pain lasting for months caused by a membrane at the anus. This is important but not common, as I have seen only 3 cases in over a quarter of a century. However, there is a common entity, frequently unrecognized, caused by spasm or hypertrophy at the anus. Here there is a history of colicky pain, worse after each feeding, with considerable straining at stool, followed by a soft, normal bowel evacuation. This condition is usually relieved by a single insertion of the small finger, although sometimes repetition is needed. I feel that this entity as a cause of abdominal pain should always be kept in mind. A radical suggestion to prevent anal disturbances would be to have the obstetrician do a rectal examination of every child before it leaves the delivery room.

DR. JOSEPH BRENNEMANN, Reading, Vt.: I yield to no one in the matter of conservatism, in the matter of using every possible means of trying to decide whether a child has appendicitis or whether it has not. I think there is no question but that there are more children operated on for appendicitis than those who really have appendicitis; nevertheless I think that it is relatively rare that one would be justified in assuming that doctors are operating on appendicitis for the sake of the operation. I have not made rectal examinations routinely. A rectal examination is an extremely unpleasant experience. I can recall only about 1 case in which I missed for a short time a small abscess above Poupert's ligament that I could find after a resident called my attention to the fact that there was a little mass on the rectum. Following operation, when there is a possible paralytic ileus a rectal examination is indicated. I do not quite appreciate why a colic is due to allergy and is present between 5 and 6 o'clock in the afternoon or between 9 and 10 in the evening almost every time instead of at the same time the bottle is given or at some other time of day. I am not unconscious of the fact that constipation makes an abdominal pain. I was guilty at one time, when we had more diarrheas than we have now, of using the expression "Thank God for constipation in a baby," because constipation we can always relieve. Diarrhea was a thing that used to bother us a lot. Why sticking a finger into a child's rectum should cure colic or should cure a condition of this sort is a little hard for me to comprehend. I have never seen it. Dr. Golomb spoke of a membrane. That is a different thing. One can put a finger, as I have done in these cases, into the rectum every day and the muscle will be just as tight the second and third and fourth day as before; but if one slips a finger into one of those that has an anal sphincter with difficulty today one can do it easily tomorrow.

Medical Facilities in the Philippine Islands.—At the end of 1938 there were about 160 hospitals with a total capacity of approximately 0.76 bed per thousand of population (United States of America, 9.7 beds per thousand of population). This included hospitals directly under the jurisdiction of the commonwealth government, general hospitals, university hospitals, leprosariums, penal hospitals, mission hospitals, private hospitals and maternity hospitals. In general, hospitals were fairly well equipped and were able to offer a variety of services. Public health laboratories were maintained in the provinces, and their facilities were available free of charge. In addition there was a large number of public dispensaries and special treatment stations. In every instance the hospitals and clinics were utilized fully, and increased capacity was a constant need. The outstanding deficiency was a notable lack of isolation facilities for patients with communicable diseases.—Simmons, James S.: *Global Epidemiology*, Philadelphia, J. P. Lippincott Company, 1944.

ABDOMINAL PAIN IN CHILDREN DUE TO ALLERGY

BRET RATNER, M.D.
NEW YORK

Abdominal pain in children at times presents difficulty in diagnosis. Every year children with obscure abdominal pain are admitted to our hospital wards and subjected to many tests to rule out such conditions as tuberculous abdominal lymph nodes, various anatomic defects of the gastrointestinal tract, recurrent appendicitis, pyelitis, kidney stones and so on. Very definite causes may be found as a result of such investigations, but on occasion the child is sent home with his condition undiagnosed. Our thesis is that in some of these children abdominal pain may be due to food allergy. The many differentiating points of interpretation of abdominal pain found in intussusception, appendicitis, dysentery, peritonitis, mesenteric lymphadenopathy, pneumonia, rheumatic fever and simple gastrointestinal disturbances will not be considered in this communication. The discussion herein is solely concerned with the evaluation of abdominal pain due to food allergy.¹

PATHOGENESIS

I have observed many guinea pigs with pronounced spasm of the intestine after an acute anaphylactic reaction when fed milk to which they were sensitized. The outstanding features of anaphylaxis in the calf noted by Code and Hester² were dyspnea followed by progressive distention of the abdomen. The abdominal skin became extremely taut. The ballooned abdomen gave a pronounced tympanitic note on percussion. In discussing the mechanism of cattle anaphylaxis recently I³ made the following observation: "The marked distention of the calf's stomach is particularly interesting inasmuch as it is a striking example of excessive preponderance of smooth muscle in a particular organ which becomes the site of the most intense anaphylactic reaction. The distention must be attributed to spasm of the pylorus and cardia. Stomach contractility finally ceases when the distention becomes excessive."

The allergic phenomenon results from a disturbed physiology, mainly of smooth muscle. It is not strange therefore that the gastrointestinal tract, which is so rich in smooth muscle, should at times be subject to allergic reactions involving its structure. Besides the spasm of smooth muscle, it is conceded that wheal formation may account for some of the pathologic disturbance, and involvement of the vessels of the intestinal wall may explain some of the more serious consequences which not only make the allergic reaction resemble acute appendicitis or intussusception in all essentials but may actually produce these pathologic conditions. Thus the primary reaction may be a spasm or wheal formation, which is followed by edema and vascular congestion of the submucosa and serosa. This in turn paves the way

for bacterial invasion and its typical suppurative picture leading to gangrene or perforation. The allergic reaction per se is reversible and the organ returns to normal without residual change. However, if the stage of necrosis is reached the condition then becomes irreversible and the appendical involvement or intussusception must be regarded as pathologic and treated surgically.

To orient ourselves with respect to the allergic phenomenon it should be recalled that: 1. When a protein food is ingested not all of the native albumin fraction is readily broken down into its degradation products by the intestinal enzymes and as a consequence some of it may pass unchanged into the blood stream as a native protein. 2. Sensitization may be acquired in various ways and may affect any part of the digestive tract from the mouth to the rectum. 3. Before an allergic reaction can occur, tissues harboring the allergic antibodies must come in direct contact with native protein; i. e., the tissue must previously have been sensitized. 4. Not only may the surface of the intestinal wall be affected, but, as the protein traverses the wall, the deep layers and vascular structures may become involved.

MODES OF ACQUISITION

1. Food allergy may have its inception in intrauterine life. In some instances the fetus may come in contact with unchanged food proteins via the placenta. Cravings of pregnancy may be responsible for the ingestion of excess protein food. Some of these proteins escape digestion and enter the maternal blood stream, thus gaining access to the fetal circulation through the highly permeable placental membrane.

2. Sensitization may also be acquired via breast milk.

3. Occasional feedings of raw milk during the neonatal period may sensitize the breast fed infant.

4. Overfeeding, whether in infancy or in childhood, in good health or during convalescence from disease, may result in sensitization. This is particularly true with raw or lightly cooked foods.

5. Fad diets, excessive indulgence in seasonal or bizarre foods, may be incriminating factors.

CLINICAL OBSERVATIONS ON ALLERGIC ABDOMINAL PAIN

Among early observations on abdominal pain were those of Moro⁴ and of Lust,⁵ who described a recurrent colicky pain in the region of the umbilicus ("navel colic"). These authors offered no positive clue as to its pathogenesis. However, Schloss⁶ was one of the first to place certain cases of abdominal pain in the category of allergy. He described cases of gastrointestinal allergy without positive cutaneous reactions. These infants regularly developed diarrhea, abdominal pain and vomiting when the smallest amounts of raw whole milk were ingested. Moderate amounts of thoroughly boiled milk were tolerated. Similar observations were later made by O'Keefe.⁷

Evidence that abdominal pain of allergic origin may be present without the confirmatory evidence of a positive skin test was fortified for me when I⁸ observed the case of a pair of twins. When these infants were given a raw milk formula, 1 twin developed urticaria

From the Department of Pediatrics, New York University College of Medicine.

Read in a symposium on "Abdominal Pain in Children" before the Section on Pediatrics at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 15, 1944.

1. Reports have appeared of definite allergic abdominal pain resulting from the use of pollens given orally for desensitization and orally administered vaccines. Allergic episodes may also result from any highly antigenic substance, such as endocrine products or other organic medication. This holds equally true for drug sensitivity to such substances as acetosalicylic acid, bromides, sulfonamides and quinine.

and the other developed abdominal pain, vomiting and diarrhea. Allergic skin tests proved positive to lactalbumin and whole milk only in the infant who developed urticaria; no skin reaction was ever obtained in the infant who had gastrointestinal symptoms. A number of subsequent clinical exposures to milk corroborated these observations. It is a common experience that local organ sensitivity may precede a generalized sensitivity; thus certain tissues of the body (e. g. the intestinal tract in this instance) may be sensitive, while others (e. g. the skin) are not.

In a number of papers Osler⁹ described a group of patients with purpura, urticaria and angioneurotic edema who in addition had gastrointestinal symptoms. He noted that abdominal pain was a common symptom and that cases occurred with or without simultaneous cutaneous eruptions. In cases simulating appendicitis, the concomitant cutaneous eruption would tend to rule out a surgical abdomen. In 1914 he¹⁰ pointed out the relation of these abdominal conditions to allergy and serum rashes. This syndrome is often referred to as "visceral erythema or hives." Alexander and Eyer- mann¹¹ also observed patients with abdominal pain who in addition manifested urticaria and purpura. A striking similarity to Henoch's purpura was emphasized. Although the elimination of certain foods caused the disappearance of symptoms, positive cutaneous reactions to foods were not obtained.

Laroche and his associates¹² and Rowe¹³ in their respective monographs cite cases ranging from mild abdominal discomfort to most intense abdominal crises, associated in certain instances with other allergic manifestations but more commonly showing no other allergic manifestations. As a rule the abdominal pain occurs promptly after eating the offending food, but it may appear from several minutes to an hour after ingestion. These symptoms may persist for several minutes, hours or even longer. When the abdominal symptoms are associated with other allergic manifestations the diagnosis is readily made. However, it is in those cases in which no associated allergic symptoms occur and there is an absence of positive skin tests that diagnostic difficulties arise. Others who have discussed this subject are Bray,¹⁴ Duke,¹⁵ Rackemann,¹⁶ Hollander,¹⁷ Lintz,¹⁸ Alexander,¹⁹ Eyer- mann²⁰ and Fries and Merrill.²¹

It might be of interest in passing to mention here the paper of McCarthy and Wiseman,²² who present

provocative evidence that pylorospasm of early infancy and its associated abdominal pain may in certain instances be due to food allergy.

DIAGNOSIS

Abdominal pain of allergic origin should always be ruled out whenever abdominal symptoms are present. It may be considered in three categories:

1. *Abdominal pain as a minor symptom.* It may appear with or without an acute attack of urticaria or asthma and usually is of little or no significance. Many children complain of abdominal pain in the course of an asthmatic or urticarial attack.

2. *Recurrent abdominal pain.* This occurs most frequently in children. Many cases give a history of colic and vomiting during infancy. It is usually associated with other dermal or respiratory allergic manifestations. The pain is usually localized in the region of the umbilicus but may also be present in the epigastrium, the paraumbilical region or the right lower quadrant. It is cramplike in character. The pain may last for several minutes or hours and may recur at frequent intervals. There are, as a rule, associated gastrointestinal symptoms such as diarrhea, flatulence, mucous stools, nausea, vomiting or even constipation. Most often this train of symptoms follows the ingestion of a particular food. Concurrent urticaria or asthma may supervene. Fever is as a rule absent but on occasion may be present. Localized tenderness may be present during the attack but is frequently absent. Occasionally a distended colon may be palpated.

A careful history of food dislikes may offer helpful clues. Protein skin tests for foods may be negative if the gastrointestinal symptoms are the only ones present but as a rule are positive if the condition is associated with urticaria or asthma. The eosinophil count may be increased, but this is not usual except in chronic cases. The entire picture may be reproduced by having the patient ingest the suspected food.

3. *Severe abdominal pain simulating an acute surgical condition of the abdomen.* Before a surgical condition of the abdomen can be considered, it is essential to give due consideration to the following points favoring allergy: (a) a previous history of gastrointestinal symptoms, or food sensitivities; (b) a history of other forms of allergy; (c) the presence of eosinophilia; (d) severe abdominal pain with physical signs that are atypical or negative. However, as was pointed out, an allergic abdominal disturbance may actually lead to a surgical condition of the abdomen. Therefore, even in the face of an allergic background, if the signs resemble appendicitis or intussusception surgical intervention may become imperative.

In all cases of suspected allergic abdomen, an injection of epinephrine subcutaneously, ephedrine sulfate by mouth or atropine or its derivatives given orally or subcutaneously may promptly relax the allergic spasm and clarify the diagnosis.

ROENTGEN DIAGNOSIS

The most concrete evidence for muscle spasm causing abdominal pain in allergy is afforded by roentgen studies. The findings are mainly those of (a) pylorospasm, (b) delayed emptying of the stomach and (c) hypertonicity and hyperperistalsis of the intestine.

Crispin,²³ in studying a case of angioneurotic edema associated with abdominal pain and hematemesis,

observed roentgenologically a lesion situated near the pylorus, which on operation was found to be angioneurotic edema. Christian²⁴ and Duke²⁵ were also among the early workers to obtain roentgen evidence of allergic disturbances. Andresen²⁶ suggested the use of x-rays in diagnosis, as did Gay.²⁶ In 1927 Eyer-mann²⁷ published the first report of the effects of the deliberate feeding of an allergenic food on the function of the gastrointestinal tract. His observation disclosed no effect in the stomach or small intestine but disharmonic tonus in the colon, hypotonus being present in the cecum and ascending colon, and hypertonus in the transverse and pelvic colon. A decidedly spastic transverse colon was demonstrated by Vaughan²⁸ in a food sensitive patient. Rowe²⁹ made roentgen studies after specific sensitizing foods were fed and found gastric retention and hypermobility and colonic spasticity. Others using intentional feedings to induce allergic reactions were Serio,³⁰ Hansen and Simonsen,³¹ Hampton,³² Wing and Smith,³³ and Cooke.³⁴

Fries and his co-workers³⁵ have made most careful and extensive studies in food allergic children. They demonstrated that peristaltic disturbances in the various parts of the gastrointestinal tract followed the feeding of allergenic foods such as egg, milk, nuts and corn. These disturbances were manifested as gastric retention, increased or decreased motility of the gastrointestinal tract, spasm or dilatation of the stomach or intestine. Gastric retention was the most common finding. It was further noted that subjective complaints referable to the gastrointestinal tract usually accompanied the objective findings.

TREATMENT

For the acute episode, the treatment of choice is epinephrine given subcutaneously. It is perhaps wisest to use epinephrine first, to be followed by atropine, belladonna or syntropan orally in order to reduce the incidence of recurrences. It is also of value to use sedation, e. g. paregoric, phenobarbital or bromides, and to continue with a combination of atropine and phenobarbital for a few days following the acute episode.

From the long range point of view the problem must be attacked by ferreting out the offending food. When it has been discovered, it should be completely eliminated from the diet, particularly if taken in the raw state. The incriminating food must be restricted from the diet for a prolonged period. Subsequently small amounts of the offending protein may be reintroduced into the diet until a tolerance is gradually established.

It has been my practice for many years to prescribe an "allergenically denatured diet" to all food allergic patients. This principle of denaturation is based on the fact that heated albumin fractions are coagulated and therefore cannot act as active allergens.³⁶ This procedure is applicable whether the offending food protein is known or is not known. In the latter case all the foods should be thoroughly cooked. Adequate amounts of ascorbic acid (50 mg.) should be given to compensate for the vitamin C lost in cooking. In the former instance only the incriminating food or foods need be subjected to heat. Following such a procedure (i. e. elimination of all raw or lightly cooked foods), if there are no recurrences of abdominal crises over a period of several months the offending food can be introduced into the diet in the raw state in very small doses, gradually increasing it until tolerance is established. After tolerance is established the offending food or foods should be consumed regularly so that tolerance may be maintained.³⁷

CONCLUSIONS

1. Abdominal pain in children may be allergic in nature.
2. Such pain may at times present difficulty in diagnosis. If no other real cause is ascertained, allergy should be suspected.
3. In evaluation of the allergic phenomenon with respect to abdominal pain, the following pathogenesis must be borne in mind:
 - (a) All the native albumin fraction of protein foods is not always readily broken down by the intestinal enzymes and part may pass unchanged into the blood stream and produce an allergic reaction.
 - (b) Sensitization must previously have been established before contact with the offending protein will result in an allergic reaction.
 - (c) Sensitization may be acquired in various ways.
 - (d) The surface as well as the deeper structures of the wall of the digestive tract may be affected.
 - (e) Any part of the digestive tract, from the mouth to the rectum, may be affected.
4. Allergic abdominal pains may be initiated by (a) spasm of the gastrointestinal smooth muscle, (b) wheal formation in the gastrointestinal wall or (c) spasm of the small vessels of the gastrointestinal walls or (d) a combination of these factors.
5. As a result of the allergic response, signs of appendicitis or intussusception may be simulated in all essentials.
6. Although the allergic reaction is reversible, if the disturbed physiology is too pronounced or prolonged the harmless allergic reaction may actually be converted into a typical acute appendical involvement or intussusception and should promptly be treated surgically.
7. Pure allergy of the gastrointestinal tract, i. e. uncomplicated by a concomitant eczema, urticaria or asthma, as a rule does not present the diagnostically valuable positive protein skin test.
8. The diagnosis must at times rest on careful historical data relative to the ingestion of certain foods.
9. Of further diagnostic value is the prompt relief from pain from the subcutaneous injection of epinephrine, or from atropine given orally.

10. Of further diagnostic value are roentgen findings when a test meal of the offending food is given: (a) pylorospasm, (b) delayed emptying of the stomach, (c) hypertonicity and hyperperistalsis of the intestine.

11. Treatment of the acute episode is best effected through the use of epinephrine given subcutaneously or atropine given orally.

12. Treatment, from the long range point of view, consists in (a) discovery of the offending food or foods, (b) the elimination of such food or foods or (c) the use of incriminating foods in "allergenicallly denatured" form and (d) the building up of a tolerance for the offending foods.

50 East Seventy-Eighth Street.

ABSTRACT OF DISCUSSION

DR. J. VICTOR GREENEBAUM, Cincinnati: The complaint of abdominal pain is a subjective symptom and demands careful analysis of many factors before one makes any final diagnosis, especially the diagnosis of pain due to allergy. Children suffering with anorexia or having pronounced dislike for certain foods often complain of abdominal pain merely on seeing food or on being asked to eat. Breakfast is the most frequent meal for this type of complaint. On the other hand, many children eat foods which they know beforehand are not good for them and which already have caused upsets. Such foods are chocolate, ice cream, excessive amounts of rich candy and the like. These foods produce attacks of abdominal pain, vomiting, chills, high fever, aching muscles and prostration, all of which symptoms are quickly relieved by getting the offending food out of the gastrointestinal tract by physics or enemas. Dr. Ratner's conception of sensitization during the intrauterine period may help to explain many early feeding difficulties which frequently disappear after treatment by the fourth or fifth pediatrician. Either the right food combination is hit on or the infant finally loses its sensitization to the offending food. The later cutaneous and respiratory disturbances, such as eczema, urticaria, dermatitis and asthma, of these infants frequently bear out this diagnosis. Gastric retention in the x-ray, mentioned by Dr. Ratner, is an excellent diagnostic help. Skin tests in my opinion also have been disappointing as diagnostic aids in this condition. Confirming Dr. Ratner's allusion to the pathologic sequels of frequent allergic abdominal attacks, I am permitted by Dr. Philip Wasserman, the pathologist of the Jewish Hospital of Cincinnati, to refer to some unpublished data. Dr. Wasserman is collecting a series of surgical cases of gallbladder and appendix infections the microscopic examination of which shows allergic reactions consisting of edema, plasma cells, and great cellular response of eosinophils in place of the usual polymorphonuclear cells. These happen to be in adults. Subsequent investigations reveal that food allergies were prominent in the past history. Perhaps proper handling of this condition in childhood might have prevented them from occurring. I should like to ask Dr. Ratner to discuss the use of histaminase and pancreatic extracts in the handling of these food allergies which produce abdominal pain.

DR. AMBROSE MCGEE, Richmond, Va.: In the past few years I have been able to collect 21 cases of fetal hiccups. In 5 of these it was possible to give the mother a food and at will to produce the hiccups in the unborn child. These children later were of a highly allergic type or whatever you want to call them. They were always crying, they were hungry or else they were uncomfortable. They had mucus in the stool and rashes, and so on. I believe that milk is the greatest food in the world for those who can take it, but even though it is a basic food there are a few who cannot take it. I have seen too many of them who stopped milk and did better. After they get to the stage where they are on something else besides milk, I think the problem is a little different.

DR. BRET RATNER, New York: Many children who cannot tolerate milk have other allergies besides their milk sensitivity. I have made it a practice to use evaporated milk, thoroughly heated, but always search for other secondary causes of the

possible allergy. I for one do not believe that allergy alone causes abdominal pain. The longer I practice allergy the more often I make the diagnosis of no allergy present. Dr. Greenebaum asked the question about histaminase and pancreatic extracts. I should like to answer that question because I think that histaminase has been one of the most fraudulent substances ever presented to the medical profession. Best and McHenry, who discovered histaminase, insisted that this substance was absolutely worthless for clinical medicine. So you see what my stand is. As to the pancreatic extracts in the use of food allergies, it seems to me that the giving of pancreatic extracts or foods that have been broken down by pancreatic digestion is unnecessary. The best method to my mind is to use denatured heated foods, such as thoroughly cooked cereals and cooked eggs. Avoid raw eggs, raw milk, raw wheat, avoid cakes and ice cream, and avoid nuts and fish. Give these thoroughly heated foods and let the pancreatic juices of the intestinal tract, which have a great predilection for cooked foods, digest them. Because the heated food albumins are coagulated, they cannot act as allergens and therefore cannot induce allergic reactions.

BLOOD AND SPINAL FLUID TESTS FOR SYPHILIS IN MALARIAL PATIENTS

LIEUTENANT COLONEL HAROLD W. POTTER

MEDICAL RESERVE, OFFICERS' RESERVE CORPS

CAPTAIN LEWIS H. BRONSTEIN

MEDICAL CORPS, ARMY OF THE UNITED STATES

AND

CAPTAIN CHARLES M. GRUBER

MEDICAL CORPS, ARMY OF THE UNITED STATES

There is practically complete agreement that malaria will be one of the postwar problems in the United States, if not from the standpoint of public health because of mosquito control, then certainly from the standpoint of economic loss and medical diagnosis and treatment. A problem that is usually not considered in relation to malaria is that of the possibility of biologic false positive tests for syphilis. Making a diagnosis of syphilis on a patient in this group may produce greater disaster than the malarial disease itself.

This study was originally undertaken at the suggestion of Lieut. Col. Thomas Fitz-Hugh, medical consultant for the Third Service Command, in an attempt to discover the effects of malaria on the spinal fluid Wassermann reaction. In setting up the procedure it became evident that a blood Kahn and blood Wassermann test taken on the same day would be of value in judging any spinal fluid results. It would also help solve the problem of the incidence of biologic false positive reactions in this disease and indicate safeguards that could be set up before a definite diagnosis of syphilis should be made.

One hundred consecutive malaria admissions had blood and spinal fluid taken within forty-eight hours of entrance to the hospital. These hundred patients gave no history of syphilis and none had had syphilis registers opened on them. Those who had positive or doubtful blood tests had repeat tests done about once a week until negative reactions were obtained. These procedures were performed in the laboratory at the same time that the routine tests for the rest of the hospital were done. Another control on the laboratory technic is the periodic checkup made by the Army with unknown serums. It is realized that quantitative titers

Technician Fifth Grade Clifford Reader performed the Wassermann and Kahn tests.

would have been of great value in this study, but the manpower shortage made it impossible to do this. Since the general practitioner does not use quantitative titers, our study may be of more practical value to him.

Total ...			10

SPINAL FLUID STUDIES

The spinal fluid Wassermann reaction was negative in all of the 100 cases. In view of the fact that 12 per cent of the men had positive blood reactions and 10 per cent had doubtful reactions, it appears that the

which some deviation of the fluid findings from the accepted normal occurred were there any symptoms or signs suggesting neurologic pathologic changes.

BLOOD SERUM REACTIONS

Table 1 shows the breakdown of the number of positive and doubtful tests. It is seen that 12 per cent showed a positive reaction in either or both of the tests used. Ten per cent showed a doubtful reaction. In all these cases the result became negative within thirty days. The doubtful reactions became negative sooner than the positive reactions. Table 2 shows the course of the blood Kahn and Wassermann reactions of these 22 patients. A definite progression from positive to doubtful to negative can be seen in some of the cases. In only 1, case 14, was there a change from doubtful to positive during the course of testing. This patient required the longest time for his reactions to become negative.

This definite evidence of biologic false blood tests led us to two standard textbooks on the subject of serologic tests for syphilis. It was felt that a physician faced with this problem would consult a book of this type in an attempt to evaluate such a finding in his

factors which produce the biologic false result in the blood are not present in the spinal fluid. The spinal Wassermann reaction, of course, is of no value in judging whether or not the blood serologic reactions indicate the presence of syphilitic infection.

One spinal fluid had 17 cells, 6 of which were polymorphonuclears and 11 lymphocytes. The total protein in this fluid was 25 mg. and the colloidal gold reaction was normal. The blood Kahn and Wassermann reactions of this patient were negative. The remainder of the fluids had 10 or less cells—a normal finding. There was no explanation for this isolated case.

In 3 cases the total protein was 75 mg. per hundred cubic centimeters. In the remainder it was 50 mg. or less. The colloidal gold reaction, cell count and spinal Wassermann were negative in each of the 3 cases. One of these men had doubtful blood Kahn and blood Wassermann reactions which were negative four days later. The second had a positive blood Kahn and a negative blood Wassermann reaction on admission. The Wassermann reaction remained negative and the Kahn reaction became negative sixteen days later. The third patient had negative blood Kahn and Wassermann reactions.

All of the colloidal gold reactions were within normal limits. In none of the cases that have been cited in

patient. Eagle¹ presents a review of the literature up to 1937 and suggests further study of the problem because of the conflicting reports. These reports vary from an incidence of less than 1 per cent to 50 to 60 per cent. His explanation of such a discrepancy is that in many instances either a flocculation or a complement

fixation test was done. In others there was no accurate gage of the incidence of syphilis in the population from which the malarial patients were taken. Kolmer² states that the incidence of false positive tests in natural and induced malaria varied from 11.1 to 19.4 per cent.

In baritosis³ the lungs are studded with small sharply circumscribed nodules which in the experimental animal are due to collections of mineral dust and do not show evidence of fibrous tissue overgrowth. Individuals with baritosis have no respiratory symptoms and do not exhibit increased susceptibility to tuberculosis.

Fig. 1 (M. C., Sept. 14, 1943).—Pseudo-nodulation due to siderosis. The pseudo-nodulation is evenly distributed throughout both lung fields. These are much more flocculent and simulate mottling more than any of the other cases. (Because this man had been in the anthracite mines for nineteen years prior to eighteen years spent as a metal grinder, we were unwilling to exclude the possibility of siderosilicosis.)

Without being able to state definitely the nature of the process, Doig and McLaughlin⁵ described the roentgen appearance of fine nodulation in 6 of 16 electric arc welders. They considered the possibility of modified asbestosis (the rods of the workers were covered with asbestos) a modified reaction to silica (the rod coating contained sodium silicate), inflammatory changes from the gases and iron oxide dust and the

remote possibility that the iron particles themselves might be casting the shadows, in the absence of fibrosis. Enzer and Sander⁶ examined 26 electric arc welders who worked an average of nineteen years with metal containing more than 99 per cent of iron and 0.1 per cent free silica. Bare rods had been used up to three years prior to their study. Five of the workers showed a roentgen appearance simulating prenodular fibrosis, and 5 others exhibited nodular shadows simulating modified silicosis. None of them had respiratory symptoms or were disabled. One of the workers who had shown fine nodulation in both lungs died of lobar pneumonia four days after a traumatic vertebral fracture. Necropsy was performed approximately sixteen months after death. It was stated that the tissues were sufficiently well preserved to permit satisfactory analysis. Throughout both lungs and the adjacent lymph nodes there was fine black pigmentation. The pigment in the lungs was distributed chiefly in the perivascular lymphatics, the subpleural spaces and the interalveolar septums. No fibrosis, no scarring and no phagocytic cells were seen. Although quantitative analysis for iron was not done,

Fig. 2 (M. C.).—Close-up to show details of pseudo-nodulation.

distributed chiefly in the perivascular lymphatics, the subpleural spaces and the interalveolar septums. No fibrosis, no scarring and no phagocytic cells were seen. Although quantitative analysis for iron was not done,

the prussian blue test was obtained in the stained sections and in the unstained residue after microincineration. No quartz was identified. The authors concluded that deposition of iron oxide was responsible for the roentgen appearance of nodulation simulating silicosis.

To the list of recorded instances of benign pneumoconiosis in baryta miners (baritosis) and in electric arc welders (siderosis) we are adding a group of cases in which we believe that siderosis occurred from prolonged exposure to finely divided iron dust from metal grinding. We have knowledge of 1 other example of benign pneumoconiosis from a different type of metal processing and there is every reason to believe that, as experience grows, many other instances of benign pneumoconiosis from metal processing and from other industrial operations will be added to this group.

In September 1943 we were requested to examine M. C., a man aged 53, who for the past eighteen years had been employed as a dry grinder for a bearings company. One month previously fluoroscopy in another hospital had revealed silicosis, he had been told. He considered himself to be in good health until

Diagnosis of Pulmonary Condition Found in Eleven Metal Grinders

Name	Age	Occupational History	Roentgen Diagnosis
M. C. (figs. 1 and 2)	53	Coal miner 19 yrs.; grinder 18 years	Modified silicosis (siderosilicosis)
L. B.	34	Grinder 12 years	Siderosis with pseudonodular predominance; pulmonary tuberculosis (inactive)
J. B.	29	Grinder 3 years	Normal chest
E. B.	51	Coal miner 2½ yrs.; grinder 3 years	Normal chest
A. C.	31	Grinder 4 years	Normal chest
W. M.	28	Grinder 4 years	Normal chest
C. P.	29	Grinder 4 years	Bronchiosinusitis
F. S.	40	Grinder 13 years	Siderosis with pseudonodular predominance; pulmonary emphysema
A. S.	45	Grinder 14 years	Siderosis with well advanced pseudonodular predominance; pulmonary emphysema
E. S. (figs. 3 and 4)	63	Grinder 17 years	Siderosis with fine pseudo-nodulation; pulmonary emphysema
E. W.	37	Grinder 7 years	Normal chest

about two years before examination, when he developed dyspnea on exertion, fatigue and gradual loss of weight. These symptoms did not incapacitate him for work. His occupational history was pertinent. He was born in the anthracite region of Pennsylvania, left school at the age of 9 and went to work picking slate in a coal breaker, working sixty hours a week for three or four years. He then became a jig operator for two years, engaged in separating slate from coal by the use of running water. He worked as a laborer outside the mines for several years and then returned to the mines as "fan boy." He then became a coal car operator and a mule driver. He spent nineteen years in the anthracite mines in these various occupations but never mined coal. In 1925 he went to work for his present employer, where he has been engaged continuously as a dry grinder. Physical examination gave essentially normal results except for the presence of slight pulmonary emphysema.

It was our primary impression that this patient by roentgenogram had simple silicosis with nodular predominance.

We have since examined 10 other grinders employed by the same company, and the findings in some of them, together with other information which we obtained, to which we will refer presently, caused us to question seriously our diagnosis of silicosis in the first case. The pertinent data of the 11 cases are presented in the

5. Doig, A. T., and McLaughlin, A. I.: X-Ray Appearances of the Lungs of Electric Arc Welders, *Lancet* 1: 771-775 (April 4) 1936.
6. Enzer, N., and Sander, D. A.: Chronic Lung Changes in Electric Arc Welders, *J. Indust. Hyg. & Toxicol.* 20: 333-350, 1938.

accompanying table. It will be noted that 4 workers who had been grinders for twelve, thirteen, fourteen and seventeen years respectively exhibited roentgenographic evidences of nodular predominance. One man in this group (L. B.) showed a coincident pulmonary lesion, probably tuberculous. He had no clinical manifestations of active infection.

Fig. 3 (E. S., Oct. 16, 1943).—Pseudo-nodulation in a man who has been a metal grinder for seventeen years. He has siderosis which simulates the pseudonodulation of the welders, except that here they are finer. This appearance may be modified by pulmonary emphysema. The nodules are very similar to those seen in silicosis and rheumatic pneumonitis.

Five employees who had been metal grinders for from three to seven years had normal chest roentgenograms. The remaining worker in this group (C. P.) had been a grinder for only four years. At our examination he had fever, tachycardia and upper respiratory infection with clouding of both maxillary sinuses by fluoroscopy. The roentgenogram showed prominence of the lung markings similar to the shadows of beading or early nodulation. We were inclined to believe that in this case the roentgen appearance was due to bronchosisinuitis.

Of the 11 grinders whom we examined, only the first one (M. C.) had symptoms referable to the respiratory tract. He had been in the anthracite mines for nineteen years but had never mined coal. He did not develop respiratory symptoms until sixteen years later, having been a metal grinder continuously for all this time. However, because of his symptoms, occupational history and chest roentgenogram, which showed an appearance more closely simulating mottling than did any of the others, we were unwilling to put him in the benign pneumoconiosis group, although we could be persuaded easily that he really belonged there. The others, including L. B., who had a coincident pulmonary lesion, probably tuberculous, had no symptoms and considered themselves to be in normal health.

Following these examinations we were granted the privilege of visiting and inspecting the bearings company, where approximately 50 grinders are employed. Seventy-five per cent of the grinding is dry and 25 per cent is wet. The metal ground in the manufacture of bearings is chrome vanadium and chrome molybdenum tool steel containing about 98 per cent iron, about 2 per cent alloy and not more than 0.2 per cent silica. Artificial abrasive wheels composed of bakelite, silicon carbide (carborundum) and aluminum oxide (aloxite) have been used exclusively for the past seven years.

Obviously, the metal which was being ground in the manufacture of bearings contained an amount of free silica totally insignificant to be a factor in the production of silicosis. It is accepted that artificial abrasive wheels of the type used in this plant do not constitute a silicosis hazard.⁷ Being unable to find any obvious exposure to free silica, we suggested that an

engineering study be made of the dust hazard present in connection with the grinding operations at this plant. This was conducted by the Bureau of Industrial Hygiene of the Department of Health of the Commonwealth of Pennsylvania. In summary the findings were as follows:

Procedure.—Dust samples were collected with a mine safety appliance company midjet impinger, using distilled water as the collecting medium. Dust counts were made by means of the light field technic. Samples for determining particle size of the dust were collected with an electrostatic precipitator. Rafter samples were collected and used as a basis for determining the percentage of free silica in the atmospheric dust. The dust concentration averaged 4,800,000 particles per cubic foot of air. In regard to particle size of the dust, 96.5 per cent were less than 5 microns and 99.5 per cent less than 10 microns. The average percentage of silica, as quartz, in the dust was 0.43.

From these figures it may be deduced that there is no appreciable silicosis hazard in this plant. Therefore we concluded that, with the possible exception of case 1 (M. C.) the correct roentgenographic diagnosis of 4 other grinders who had worked in this plant for from twelve to seventeen years was benign pneumoconiosis (siderosis) with pseudonodulation. The roentgen appearance of this condition is similar in all respects to that found in electric arc welders.

It may be of interest in this report, which records the occurrence of siderosis in a group of metal grinders, to refer to a patient who for the past nine years has exhibited the roentgen appearance of pseudonodulation, although he has never been exposed to any industrial dust of any kind:

J. S. was seen first in December 1934 at the age of 19. In 1931 he had chills, fever and hemoptysis followed by dyspnea, palpitation, loss of weight and fatigue. He had recurrence of similar symptoms in December 1934, accompanied by pain in the right lower quadrant, for which appendectomy was performed, but no evidence of acute inflammation was found. On the fourth postoperative day he was transferred to the medical ward suffering from recurrence of acute rheumatic fever with the cardiac findings of mitral regurgitation and stenosis and partial consolidation of both lungs. He was febrile for five weeks, and his sedimentation rate remained elevated four additional weeks.

Fig. 4 (E. S.).—Close up to show details of pseudo-nodulation

Roentgen examination of the chest on Jan. 8, 1935 showed a diffuse process involving the upper two thirds of both lungs resembling a confluent bilateral pneumonitis. On the right there were some rounded shadows such as one finds in nodulation.

Additional roentgen examinations were made of the chest during this hospital admission and many diagnostic possibilities were considered: miliary tuberculosis, fungous infection and a fusospirochetal infection. Passive congestion was excluded

7. Clark, W. I.: The Dust Hazard in the Abrasive Industry, *J. Indust. Hyg.* 13: 343-346, 1931

because the lesions preponderated in the upper two thirds of the lung fields.

It was concluded that the most likely diagnosis was rheumatic pneumonitis. In this connection it should be mentioned that Dr. Francis C. Wood, who examined the patient shortly after admission, made a diagnosis of acute rheumatic fever with peritoneal pleural and pulmonary involvement. He was discharged from the hospital feeling well and since then has been followed periodically in the cardiac clinic.

Chest roentgenograms have been made at frequent intervals up to May 1944, and since the first year the changes have been largely those of pseudonodulation.

In order to determine if possible the nature of the lung lesion, which has remained essentially unchanged in its roentgen appearance during the past nine years, it is necessary to consider briefly the pulmonary changes which have been described in acute rheumatic fever and to reconcile these with the present roentgen appearance presented by this patient. According to Gouley and Eiman⁸ the specific pulmonary lesion of acute rheumatic fever is nonsuppurative inflammatory vascular damage with perivascular infiltration, for which they suggest the term "perivascular pneumonia." Paul⁹

comments on the frequency with which focal hemorrhagic lesions and extremely hemorrhagic alveolar exudate are found at necropsy. He emphasizes that the usual and expected chronic passive congestion would much more likely have involved the lower lobes. Coburn¹⁰ concludes that diffuse hemorrhagic changes are characteristic of activity of the rheumatic process. Sostman¹¹ states that he has observed several patients with long standing passive congestion from mitral

Fig 5 (April 6, 1943).—Pseudonodulation in a patient who had acute rheumatic fever with rheumatic pneumonitis in 1934. There is no history of exposure to any occupational dust. The pseudonodulation in the upper two thirds of both lung fields had remained practically unchanged since the first year. The cardiac enlargement is due to mitral stenosis and regurgitation.

trical stenosis who have developed a finely nodular roentgen appearance simulating the nodulation stage of silicosis. At necropsy the individual nodules are fibrotic and contain much blood pigment which takes the specific stain for iron. Perhaps it may be found that the roentgen appearance of pseudonodulation in this patient's lungs is due to the shadows cast by iron pigment, the end results of the hemorrhagic perivascular infiltration of acute rheumatic fever. This may be an example of endogenous siderosis from blood destruction.

COMMENT

Many other conditions besides silicosis and benign pneumoconiosis may produce a similar roentgen appearance in the lungs. Among these are metastatic

cancer, Hodgkin's disease, miliary tuberculosis, lipoid pneumonitis, fusospirochetal disease and fungous infections of various kinds.

Differential diagnosis between pneumoconiosis of any variety and any of the conditions that have just been enumerated depends largely on the clinical features of the case, a searching history to establish or exclude an occupational exposure to dust, a thorough physical examination and appropriate laboratory studies.

It is impossible for the roentgenologist to tell the difference between the nodulation resulting from the reactive fibrosis produced by free silica in the lung tissues and the shadows of pseudonodulation cast by the opaque substance itself in benign pneumoconiosis. Therefore, in order to differentiate between silicosis and benign pneumoconiosis one must have recourse to a most detailed occupational history and, whenever possible, first hand knowledge of the environmental conditions surrounding the worker. Frequently an industrial engineering survey of the plant must be made to determine the nature and concentration of the dust to which the employee is exposed.

Advanced silicosis with conglomerate nodulation is often a disabling disease, and when silicosis is complicated by tuberculosis it is fatal. Asbestosis, when extensive, reduces pulmonary ventilation. This may embarrass the right side of the heart and induce cardiac failure.

Benign pneumoconiosis produces nothing but "shadows cast on a roentgenogram."

For these reasons it is unfair to the worker, to labor and to industry for the clinician and the roentgenologist to take their responsibility lightly when they are called on to distinguish between silicosis or asbestosis on the one hand and benign pneumoconiosis on the other.

SUMMARY

To the list of the benign pneumoconioses previously recorded we are adding 4 cases of siderosis occurring in metal grinders. In this group silicosis has been excluded by eliminating significant exposure to free silica. This has been achieved by knowledge of the composition of the metal ground, by being informed of the nature of the abrasive wheels used, by personal inspection of the plant and by the report of an industrial engineering survey.

We know of 1 other example of benign pneumoconiosis resulting from the inhalation of a different metal and it is predictable that, as knowledge of this condition grows, many other instances of benign pneumoconiosis from metal processing and other industrial operations will be added to this group.

It is impossible to differentiate the roentgen appearance of nodulation of silicosis or the pseudonodulation of benign pneumoconiosis from the shadows cast by many pulmonary diseases unassociated with the inhalation of dust. The diagnosis of the pulmonary lesion in such circumstances depends on the collaboration of the internist, the roentgenologist and the laboratory technician.

To differentiate between silicosis and benign pneumoconiosis one must have a detailed knowledge of the occupational history, the environmental conditions of the worker and the precise information regarding the nature, concentration and particle size of the dust to which he is exposed.

Advanced silicosis is usually disabling and, when complicated with tuberculosis, it is fatal.

Advanced asbestosis produces disability and ultimately may induce death from cardiac failure.

Benign pneumoconiosis produces nothing but shadows cast on a roentgenogram.

We owe to the worker, to labor and to industry our utmost efforts to distinguish between these conditions.

ABSTRACT OF DISCUSSION

COLONEL A. J. LANZA, M. C., A. U. S.: All that casts a shadow on an x-ray film of a working man is not necessarily a disabling disease. That is a lesson some of us learned the hard way, and it needs to be emphasized. The men at the University of Pennsylvania Hospital as far back as 1920 were among the first in this country to devote any considerable attention to pulmonary disease among industrial workers. The introduction of x-ray examinations into industry came as a result of pulmonary industrial diseases and their clinical manifestations, which had reached such a point that they attracted general attention; and in the early days we limited our examinations to men who had clinical symptoms and we confirmed our diagnoses by an x-ray film. As the use of the x-rays spread and we became accustomed to seeing films of thousands of apparently healthy persons who were working every day, we began to realize that we would have to change our ideas. We became more and more conservative in our interpretation and more and more insistent that we know the clinical history and especially what type of exposure the individual had experienced not only in his present job but in previous jobs. In dealing with occupational diseases of the lungs it is necessary to build up an occupational history of everything the workman has done since he has left school and gone to work. Otherwise one might fail to find out that perhaps fifteen years before the examination he worked in a granite quarry or in a hard rock mine for a period of years and said nothing about it, and that what one saw on the film might date back a considerable number of years. We began to appreciate the fact that maybe some shadows didn't have any clinical significance. For instance we accumulated a whole series of films out in the Southwest that showed all the appearances of military tuberculosis but after we had gathered 125 of them in a small community we realized that there could not possibly be 125 persons with healed military tuberculosis in the same community, all of them in the best of health and none ever having been sick. Dr. Pancoast coined a happy phrase that met this situation. He said "Let's not talk about a 'normal' chest. We see normal chests probably only in children. As men grow older and women too you will find all sorts of shadows in their chest x-rays. Let's speak of a 'healthy' chest." If on the basis of increased age and of x-ray technic and interpretation, plus the clinical background and the occupational history of the individual, we can separate those who have a healthy chest from those who have an unhealthy chest, we shall have made a tremendous contribution to the medical practice of industry.

DR. I. S. TROSTLER, Chicago: In examining these chests with the fluoroscope we shall find that the patients with benign pneumoconiosis will have normal respiratory excursions of the diaphragm, and in those cases we are generally pretty safe in making that as a diagnosis, no matter what the shadows are. One of the early, if not the first, roentgen findings in true pneumoconiosis is diminution of the respiratory excursions of the diaphragm.

DR. NORBERT ENZER, Milwaukee: Since the report that Sauder and I made in 1938 we have had three opportunities to confirm that original observation by postmortems on welders who died of conditions entirely unrelated to their occupation. These cases were identical, and one could exchange and shuffle the slides and not be able to identify them as belonging to any one particular case. The lesion in pulmonary siderosis is entirely a macrophage reaction. The iron pigment is taken up by the macrophages; these localize in the perivascular and peribronchial lymphatics and in the alveolar septums. We could not identify any other reaction in the lungs. There is no other inflammatory response, nothing in the nature of a granulomatous

reaction; the macrophages are not converted to fibroblasts. The blood vessels in these lungs show no changes from the normal. When we compare these findings with those occurring in lesions of the lungs which are characterized by granulomatous transformation, the essential feature differentiating the two processes is the absence of a collagenous deposit and all of the steps that go to form collagen; in other words, from the primary response up to the maturation of the fibroblast. Lesions which form collagen ultimately will affect the blood vessels of the lung. I was interested in the reference to the pulmonary findings in mitral stenosis. Our observations on a few such cases are that those lesions may be due to organization of macrophages filled with hemosiderin. It is possible to recognize benign pneumoconioses, particularly siderosis, by applying our knowledge of what goes on in the lung and interpret the film from that point of view. There are some differences. We have read correctly eleven out of twelve unidentified films as coming from welders. If one studies the shadows carefully, particularly in a film that is magnified, the shadows are not solid—they are ringlike. They have a tendency to undulate in an irregular linear fashion. Pulmonary siderosis causes an accentuation of the architecture of the lung in contrast to those pneumoconioses in which fibrous formation cause a displacement or replacement of lung tissue. In the latter there seems to be a solid formation, a solid nodule; in the former the pulmonary alveoli are accentuated by the deposit of iron, thus bringing out the spongy architecture of the lung.

THE MALE CLIMACTERIC

REPORT OF FIFTY-FOUR CASES

AUGUST A. WERNER, M.D.

Assistant Professor of Internal Medicine, St. Louis University
School of Medicine
ST. LOUIS

Both the human male and the human female have a pituitary-gonad relationship. In the girl at puberty the anterior pituitary gonadotropic hormone stimulates the ovaries to function, with the development of a graafian follicle and the production of an ovum. The granulosa cells lining the follicle produce estrogenic hormone, which in turn stimulates development of the breasts, the internal and external genitals and the configuration of the body, which changes from that of the girl, through adolescence to womanhood.

In the boy at puberty the anterior pituitary gonadotropic hormone stimulates the testicles to function. The interstitial cells of the testicles produce androgenic hormone, which causes development of the secondary sexual characteristics and initiates the changes that develop him from boyhood through adolescence to normal manhood.

The most obvious and fundamental difference which occurs as a result of this pituitary-gonad relationship in the human male and female is the fact that the normal woman menstruates.

Menstruation is the end result of a periodic preparation of the uterine mucosa to receive a fertilized egg. If pregnancy does not occur, hormonal interactions result in uterine bleeding. This periodic preparation of the uterine mucosa is necessary in the woman for propagation of the species and is obviously not necessary in the man.

The menstrual cycle may be looked on as an extra phenomenon in the woman and not as an occurrence necessary to her sense of well-being. If the uterus is removed and the ovaries are healthy and their function

The Roche-Organon, Inc., Nutley, N. J., supplied generous amounts of testosterone propionate (Neo-Hombreol).
Read before the Section on Miscellaneous Topics, Sessions for the General Practitioner, at the Ninety-Fourth Annual Session of the American Medical Association, Chicago, June 15, 1944.

is not disturbed, her pituitary-gonad relationship will continue as it does in the man and she can and will feel perfectly normal until the climacteric is reached.

It follows, then, that cessation of menstruation is not the climacteric and is not of such great importance as was formerly supposed. Cessation of menstruation is only visible evidence in the woman that there is beginning decrease or cessation of her ovarian function. The climacteric syndrome is the result of the endocrine imbalance and not the result of the menstrual disturbance.

As a result of the overemphasis which has been placed on the cessation of menstruation in the woman, and because the man does not have this phenomenon, it was believed that the man did not have a climacteric. There is absolutely no basis for the belief that the man does not have a decrease in sex function in later life and that he cannot have a climacteric. Probably a greater number of men than of women pass through the climacteric without any evident disturbance. However, this inference may be based on the fact that knowledge of the occurrence of this syndrome in man is of very recent date and that the condition possibly has been overlooked or ignored. The climacteric usually occurs later in men than in women. The average age of onset in women is about 40.8 years, and in men it occurs from approximately 45 to 55 years.

It is also a well established fact that neither the man nor the woman need be of climacteric age to develop typical climacteric symptoms. If a girl has her ovaries completely removed at 25 years of age she will have the typical syndrome; under similar circumstances the man will have these symptoms.

The endocrine imbalance in which the gonad hypofunction seems to be the chief factor, in conjunction with the anterior pituitary, disturbs the equilibrium of the two divisions of the autonomic nervous system with the resultant climacteric syndrome. These symptoms may vary from mild to extremely severe, in which latter instance the patient may develop climacteric psychosis (involutional melancholia).

In previous articles¹ the symptoms in the woman and in the man which accompany gonadal hypofunction or afunction, whether they are due to castration, insufficient gonad response or the climacteric, were outlined and described.

SUBJECTIVE SYMPTOMS

Since the climacteric is the result of a neuroendocrine imbalance, it is necessarily functional. The subjective symptoms accompanying gonadal hypofunction render the patient more uncomfortable than do the objective signs. As reported for the female, the symptoms in the male may be classified as (1) nervous, (2) circulatory and (3) general, as shown in the accompanying tables. A proper evaluation of the significance of these symptoms is the chief basis for a diagnosis. That these symptoms may be more easily recognizable, they will be described as they have been presented to me by a large number of patients of both sexes.

NERVOUS SYMPTOMS

All patients complained of an intense subjective nervousness or a feeling of tension. There is a sensation of an inward tremulousness, which usually does

not become manifest as a tremor. This is especially noticeable on arising during the night or in the morning. Excitement or fatigue accentuates it, and then a tremor may be noticeable, which should not be attributed to hyperthyroidism.

Nervous people are irritable and they are easily aggravated or excited to anger by word or deed. Noises of playing children, the radio, almost anything stirs them to action. In fact, they need no special stimulus. They are hard to please, and frequently the family or associates say that they can hardly get along with them. Many patients acknowledge this condition but state that they cannot help being so.

Excitability is a nervous state in which the persons respond to ordinary stimuli in an exaggerated manner, especially as regards the psychic response. Unfavorable news, slight mishaps, arguments, all manner of little occurrences that would not disturb a normal person cause quite a nervous and mental flurry.

A large majority of these patients complain of sleeping poorly. They may be restless, sleeping only for short intervals during the night. Some fall asleep quickly on retiring, only to awake within a half hour and remain awake for varying lengths of time. Others do not sleep on retiring until after midnight. Some complain that they sleep well until 2 or 3 a. m. and then remain awake until morning. Patients who do not sleep at night find themselves exhausted the next day and must sleep during the daytime. This desire to sleep during the daylight hours must not be confused with somnolence.

Numbness and tingling of the hands, feet or one or more of the extremities often occurs. Frequently these people awake while lying in bed and find the extremities completely numb. Some have stated that they had to sit up and rub their arms or legs, and one person awakened and arose to go to the bathroom and fell to the floor because the feet were numb. Formication, a sensation as if ants or insects were crawling over the skin, especially on the back and body, is frequently complained of. There may be itching, prickling or tingling of the skin.

Headaches of various types and location occur but are rarely migrainous. They may be described as a dull to severe ache, usually not neuralgic, and may occur irregularly or be continuous. Their location may be temporal, frontal, vertex or occipital, with any combination of these. There are two types of headaches which have almost specific diagnostic importance in gonadal hypofunction: vertex and occipitocervical. The occipitocervical ache may radiate to the neck, over the scapular regions or down the spine. It may last from hours to several days and, when present, the patients complain that their mind seems hazy or fogged, and this mental haziness may last for days. The vertex ache is frequently described, as if a great weight were resting on the head, or as a feeling of pressure.

There is decreased memory and ability for mental concentration. Cerebration is slowed, and they are forgetful, especially for recent events. If they read an article they cannot tell what they have read and must reread it several times before it registers; names, figures and dates are especially difficult to remember.

Depression or mild melancholia is an important symptom; when this is present the patients have loss of interest in their work, in their home or in their past pleasurable diversions; they want to avoid people and may cry for no special reason. They realize that there is something wrong within themselves, they

1. Werner, A. A.: Syndrome Accompanying Deficiency or Absence of the Ovarian Follicular Hormone. *Endocrinology* 19: 695 (Nov.-Dec.) 1935; The Male Climacteric. *J. A. M. A.* 112: 1441 (April 15) 1939; The Male Climacteric: Additional Observations of 37 Patients. *J. Urol.* 49: 872 (June) 1943; *Endocrinology: Clinical Application and Treatment*, Philadelphia, Lea & Febiger, 1943; Symptoms Accompanying Ovarian Hypofunction.

become introverts and they are ill at ease, have fear of some impending danger and worry unnecessarily. One man worried and cried while at work because he thought that his wife might smoke cigarets while he was away. There is a loss of self confidence and a feeling of futility. At this stage of the condition these patients verge on psychosis, may be self accusatory, may have thoughts of self destruction and may actually commit the act. This extreme stage has previously been referred to as involuntional melancholia; it is a psychosis but of definite endocrine origin, as just described.

CIRCULATORY SYMPTOMS

Hot flushes are characterized by a sudden redness of the face and neck, upper chest and at times most of the body. This is akin to blushing and is due to dilatation of the superficial capillaries of the skin. It is a very uncomfortable sensation, generally of short duration, but it may last half an hour or even longer, if the statements of some patients are correct. Frequently this is described as a smothering sensation. Profuse perspiration may accompany the hot flushes. Chilly, creepy sensations occur at times, and these are the counterpart of hot flushes. There may be vertigo and scotomas or tingling or prickling sensations over the head, neck and body. Occasionally hot flushes may accompany disturbances of the cardiovascular system, especially arteriosclerosis with hypertension, but these conditions can be eliminated by proper diagnosis.

Tachycardia, palpitation and dyspnea, more than usual on moderate effort, without evident cardiorenal disease is complained of. Walking a short distance, ascending a flight of stairs, almost any moderate effort causes cardiac consciousness. Many of these patients have this group of symptoms occur while sitting quietly or even while lying in bed. At times they are awakened from their sleep by tachycardia and palpitation.

Vertigo, especially with change of position, is often noticed, with no cardiovascular condition to account for it. Vertigo, tinnitus and scotomas are usually associated symptoms; of these vertigo occurs most frequently. Scotomas may occur as dark, red or silvery specks floating or dancing before the eyes.

Cold hands and feet at any season are complained of by many of these patients. The pulse is usually not affected much unless there is some intercurrent condition, and the blood pressure may be increased in an occasional patient, perhaps the result of nervous tension.

GENERAL SYMPTOMS

Lassitude and fatigability are often present. Some of these people state that there is often pronounced decrease of endurance, and they fatigue easily. Others complain that they are constantly tired or that on arising in the morning they are unrested or feel more tired than when they went to bed.

Vague pains are complained of, and their location may be as legion as the distribution of the nervous system. However, when a patient complains of pain, one must make a definite effort to determine its significance before it is lightly dismissed.

Potency is something apart from libido. Potency is more easily determinable in the male than in the female for obvious reasons. Libido in a large degree depends on the mental reaction and may be present in the absence of potency. I have had quite a few women state that libido was more pronounced during the menopause than at any other time in their life. This can be easily explained in both sexes because libido operates

through the conscious mind. In many instances the decline or loss of potency and the persistence of libido causes many men to consult the physician.

Constipation is frequently found in hypofunction of the thyroid and pituitary glands in which there is a relative vagotonia. Many of these patients complain of a gastric syndrome characterized by distention and eructation after meals with no organic lesions. This is probably secondary to the nervousness and the constipation and usually disappears with sedation and proper elimination. While some cases of constipation may have a glandular basis, the vast majority are probably due to improper habits, diets, gastrointestinal disease and other conditions.

STUDY OF FIFTY-FOUR PATIENTS

The symptoms that accompany the male climacteric are shown in the tables. It is well to remember the fact that these symptoms not only accompany the climacteric but may be present at any time in some individuals when there is much decrease or failure of gonadal function during active sexual life.

In this group of patients there were 2 having cryptorchism and eunuchoidism, 3 having hypogonadism,

1 having surgical and postoperative testicular atrophy and another having testicular atrophy as a result of x-ray treatment, 44 in the male climacteric and 3 having climacteric psychosis. The age of these patients considered, as a whole, ranged from 41 to 64 years; the average age for the group when they first sought medical attention was 50.5, which is much later than the average age for the onset of climacteric symptoms (40.8 years) reported in 1931 in a study² of 197 women having ovarian hypofunction or afuction, 96 of whom were in the menopause.

Nine of these patients were single, 41 were married, 2 were widowers and 2 were divorced. The average height was 65½ inches (166 cm.) and the average weight was 155 pounds (70 Kg.). Obesity was strikingly less frequent in this group of men than in a similar group of women; only 8, or 14.8 per cent, were overweight, whereas 34 per cent of 197 women were obese. This paucity of obesity in men as compared to women may be due to several influencing factors, chief among which may be (1) that men are more active physically than women and (2) that women during the menacme, during each menstrual period and during and at the end of gestation are subjected to a tremendous glandular readjustment to which men are not sub-

2. Werner, A. A.: Symptoms Accompanying Ovarian Hypofunction, J. Missouri M. A. 28: 363 (Aug.) 1931.

jected; frequently in women this readjustment does not completely occur, with consequent menstrual disturbances and obesity.

The average pulse rate was 72 per minute; the average blood pressure was 129/83 mm. of mercury. The highest systolic pressure found in any individual was 190 and the lowest diastolic pressure was 65.

The average basal metabolic rate was + 6 per cent in 5 patients, 0 per cent in 4 and — 17 per cent in 38. That this group of symptoms is not due to hypothyroidism is evidenced from the clinical experience of many observers, by the fact that patients having plus or minus metabolic rates have the symptoms and that they are not relieved by thyroid medication. Many of these symptoms when considered individually may accompany other conditions, but when a proper diagnostic survey fails to reveal any abnormality to account for them they must be evaluated from a functional point of view, especially endocrine.

Decrease or loss of potency was admitted by 90.8 per cent, and the remainder said “no.”

Libido was decreased or absent in 45.4 per cent, 29.6 per cent answered “yes and no,” and 14.8 per cent stated that it was unchanged. In 5 patients this information was not obtained.

Thirty-eight patients received intramuscular injections of 25 mg. of testosterone propionate every other day, omitting Sunday. Of these, no subsequent report was obtainable on 2; of the remaining 36, all were benefited by relief of symptoms and a sense of well-being.

REPORT OF CASES

So that the hypogonadal and climacteric syndrome in the male may be made more easily recognizable, the following type cases are described: (1) cryptorchism, bilateral, (2) castrate, (3) hypogonadism, (4) climacteric and (5) climacteric psychosis. All irrelevant and negative information will be omitted from the protocols for brevity.

The following is a case of bilateral cryptorchism with mild hypothyroidism:

CASE 1.—L. R., an unmarried man aged 52, showed intense subjective nervousness, depression and crying, decreased ability for mental concentration and memory for recent events, forgetfulness and severe occipitocervical aching, accompanied by mental haziness. The testicles had never descended and were not palpable in the inguinal canals. He was fatigued most of the time and arose in the morning unrested. Sleep was restless and he perspired much at night. Constipation was very troublesome. He began to gain weight rapidly at 27 years of age. He had never been severely ill and had not had any operations. His height was 70 inches (178 cm.) and his weight was 234 pounds (106 Kg.) nude. The skin over the entire body, face and extremities was sallow, pastylike and scaly. There was much adiposity over the trochanters, hips, suprapubic region and

the mammary areas, and only a sparse amount of pubic hair was present. The bodily configuration showed the effect of the lifelong deficiency of gonadal function; the general appearance was than of a eunuch instead of eunuchoidism. The pulse rate was 84 and the blood pressure was 165/120. The penis was 3 inches long, was small and had a long prepuce. The testicles were not palpable and the scrotum was small, flat and wrinkled. The prostate was not palpable because of failure to develop.

The hemoglobin, red and white cells and the blood picture were normal. The fasting blood sugar was 112 mg. The urine was normal.

The basal metabolic rate was — 15 per cent. The patient had taken 2 grains (0.13 Gm.) of desiccated thyroid for years, without any change in the condition described.

Twenty-five mg. of testosterone propionate in oil was injected intramuscularly every other day for three months. After three or four injections he began to feel better, and at the end of three weeks he was having many erections. The skin of the entire body changed from a pale sallow to a bright pink. The penis developed to 4 inches in length and 1 inch in diameter when flaccid. He stated that he felt “fine and vigorous.”

The following patient was a castrate; one testicle was removed and the other atrophied from x-ray treatment:

CASE 2.—W. G., a man aged 40, married, had been operated on at 32 years of age, his right testicle being removed because of a suggestive nodule which it contained. Following this removal he received high voltage x-ray therapy eight times to the pelvic region and he stated that the left testicle was not protected. During the next two years the left testicle atrophied, and when he was examined it was small and soft.

As a result of the operation and atrophy there developed intense subjective nervousness, frequent hot flushes followed by profuse perspiration, depression and crying with decreased memory and ability for mental concentration; he could hardly remember anything. He stated that he had a feeling that he was losing his nerve and confidence in himself and that it was an effort for him to think and talk extemporaneously. He was

ill at ease, felt anxious and had some unexplainable feeling that something would happen, without good reason.

He was exhausted most of the time, and it was an effort to work. There was a loss of interest in his usual activities. He had tachycardia, palpitation and dyspnea on light effort. He had occipitocervical aching most of the time, and this was becoming worse, with frontal aching just above the eyes. He also had some sacroiliac soreness, which was annoying. At times he slept well and then again he had periods of disturbed sleep. He had an erection and coitus about once every six weeks but usually was unable to complete the act. Most of these symptoms had been present since the x-ray therapy six years before.

His wife and 2 daughters were living and well. The family, personal and past histories as far as they related to his present condition were negative.

His height was 69 inches (175 cc.) and his weight was 173 pounds (78.5 Kg.) nude.

Physical examination revealed nothing abnormal, except that there was a long scar paralleling the right inguinal region. The right testicle was absent and the left was small and soft.

The prostate was moderately decreased in size and showed increased firmness and was not tender. The prostatic fluid did not contain pus or spermatozoa.

The heart was normal, the action was regular, the pulse was 72 and the blood pressure was 120/75.

The blood and urine were normal for all the usual tests. The basal metabolic rate, two tests, was 0 per cent in each instance.

The diagnosis was castrate right side, testicular atrophy left side.

The patient was given 10 mg. of testosterone propionate, injected intramuscularly every other day, omitting Sunday. Two months later he reported that the symptoms were very much relieved and that a lumbosacral soreness, which he had had, had disappeared. He had been having erections twice a week. He had more energy, could work better and felt like taking active exercise.

With our present knowledge it would have been better to give this patient 25 mg. dosages instead of 10 mg.; the response would have been more rapid and satisfactory.

The following was a case of hypogonadism:

CASE 3.—W. S., a man aged 37, began his career as an office boy at 16 years of age and later became a salesman for the same firm, which position he held when he sought consultation.

For the past four years he had noticed decreased libido and potency. He had been very subjectively nervous and depressed, had become introverted and worried unnecessarily about himself. He was apprehensive, had decreased memory and concentration and loss of interest in his activities at home and in business and felt that he could not hold his position. He was ill at ease and had a fear of impending danger. He tired easily, and it required an effort to continue at his work; he tried to avoid company and became excited if he got into a group of people. He was subject to vertex headaches, vertigo with chance of position and tinnitus. He had tachycardia and palpitation, even while lying in bed. There was numbness and

tingling of the extremities at times. He could not sleep after midnight and suffered from constipation. He had never been seriously ill and had had no operation.

He married at 20 years of age, and the wife and 2 children were living and well.

The family history was negative.

His height was 67½ inches (171 cm.) and his weight was 139 pounds (63 Kg.) nude. He was apparently normal physically, the heart seemed normal, the pulse rate was 66, lying down, and the blood pressure was 132/85.

The external genitals were normal, and the testicles had normal consistency.

The usual blood and urine tests were normal, and the basal metabolic rate was —7 per cent.

The diagnosis was hypogonadism, which could have been secondary to pituitary hypofunction or failure of the testes to respond normally to gonadotropic stimulation.

Twenty-five mg. of testosterone propionate was injected intramuscularly every other day, omitting Sunday. After two weeks he stated that he felt much better and slept soundly. At the end of one month he felt very well.

CASE 4.—H. K., a man aged 49½, married, a broker, had noticed himself "slipping" in several ways during the last eighteen months. He had decrease of libido and potency, which had been pronounced in the last two months. He was very nervous subjectively, irritable and excitable and at times felt like screaming. He was depressed and had a feeling of frustration, and he stated that he thought of suicide about six times. He had decreased memory and mental concentration and lost his train of thought while talking. He was ill at ease and had a feeling of some unexplainable danger. There was a loss of self confidence. He had occipital-cervical aching for almost one year, and his mind seemed hazy. He had vertex headache frequently and constant tinnitus for the last eighteen months. He also had a feeling as if he would faint if he turned his head to the left and had to snap it right back. Pressure on the carotid plexus did not elicit this symptom. He fatigued easily and was exhausted after a day's work. He slept poorly and lay awake for hours. He had tachycardia, palpitation and dyspnea on moderate effort, and this also occurred while he was lying quietly in bed. The hands and feet were cold, and there was numbness in both arms and generalized itching. He had hot flushes, especially when nervous, followed by profuse perspiration. At times he had felt as if a hot pad was applied to one or both thighs. He had distention and eructation after meals and felt as if there was a lump in his stomach.

His height was 66 inches (168 cm.) and weight 147 pounds (67 Kg.) nude. The hair was dry, but the skin had normal moisture. The heart was normal in size, the action was regular and there were no abnormal sounds. The pulse was 72 and the blood pressure was 120/75 mm. of mercury. The external genitals were normal and the testes had normal consistency. The prostate was about normal in size and slightly increased in consistency.

Examination of the blood and urine showed all tests to be within normal limits. The basal metabolic rate was minus 21 per cent on two tests.

He was given 25 mg. of testosterone propionate injected intramuscularly every other day, omitting Sunday. He was given 2 grains (0.13 Gm.) of thyroid daily.

After two weeks' treatment he stated that he felt very well and that libido and potency were increased. The treatment was continued for two months.

The following patient had climacteric psychosis (male involutional melancholia):

CASE 5.—A man aged 58, married, became depressed about eighteen months before he came under observation and had decreased memory and concentration and loss of interest in his work and other activities. He was fatigued and had numbness and tingling of the extremities, even while lying in bed.

His condition became gradually worse. He could not work, seemed terribly worried, did not want to see any one and would not talk but would hold the newspaper in his hand for long periods without turning a page or would stare out of a window with a blank expression.

At that time he attempted suicide by inhaling gas and was taken to a sanatorium, where he remained for several months without improvement.

He was then given 25 mg. intramuscular injections of testosterone propionate every other day. Within two weeks he made decided improvement and stated that he felt "very fine." He also stated that he had accentuated sexual stimulation, which had been absent for two years; this statement was corroborated by his wife. After one month of this treatment he was cheerful but very talkative and wanted to go to work. At the end of the second month he was allowed to resume his work and got along nicely.

COMMENT

This report represents a study of 54 male patients, each of whom had one of the types of testicular hypofunction or afunction, which is, or can be, the etiologic factor in producing the hypogonadal or climacteric syndrome. With the exception of menstruation in the female, it is the same for the two sexes.

The symptoms have been discussed, so that the syndrome may be easily recognizable.

Testosterone propionate, by intramuscular injection of 25 mg. three times a week, has been found effective in relieving the symptoms and in the production of a sense of well-being in the patients, which is the primary objective of this treatment. This medication should be administered for two or three months. The patient may feel very well within a few weeks, but it is best to continue beyond this time for the purpose of stabilization. Testosterone may also be given orally, by inunction and by implantation. The effective oral dosage is three to eight times greater than by intramuscular injection. Inunction of testosterone is not so satisfactory. By implantation, one has no control of dosage.

Testosterone should not be given for the purpose of stimulating potency. While it occurs in some patients, this result cannot be promised and it is perhaps better for older men if this phase of the reaction does not result.

It is important that the duration of the climacteric be stressed, since it varies in different individuals. Some pass through this without much appreciable difficulty; some may have trouble for three to six months, and in others the period for permanent endocrine equilibrium to occur may be from one to four or five years. The latter group will need intermittent treatment for one to three months when aggravating symptoms recur.

403 Humboldt Building. _____

ABSTRACT OF DISCUSSION

DR. CHARLES W. DUNN, Philadelphia: The constitutional attributes of testosterone supersede its sexual stimulatory powers. This can be established in any male eunuchoid or castrate. The administration of estrogen to a male castrate suppresses the flashes and drenching sweats and relieves the other vasomotor reactions but does not relieve the energy deficit or establish the sense of well being. Only male hormone therapy accomplishes both therapeutic responses in the male castrate. When testosterone is administered to male hormone deficiency patients in dosage proportionate to their deficiency—including the climacteric—the initial therapeutic response is constitutional. The male climacteric is a deficiency state of the body and must be so treated and corrected if it is desired to obtain symptomatic control. Dr. Werner stated that 2 of his patients attempted suicide; 4 of my patients attempted suicide, and 1 succeeded. The male climacteric is an important syndrome because it occurs chiefly in men with important responsibilities, men who require

sustained energy, physical and mental, throughout the day to perform competently their assigned responsibilities. The progressive loss of physical and mental energy which the male climacteric experiences is the substratum on which major mental symptoms develop and precipitate the inferiority and inadequacy complex. The male climacteric requires therapy and adequate therapy. The dosage varies with the duration of the disturbance, the type of symptoms, their extent and their intensity. The initial dose should be maximal, 25 to 50 mg. two or three times a week for two to four weeks. As the constitutional responses, disregarding sexual, are obtained the dose is reduced. The true climacteric patient is more concerned with constitutional rehabilitation than he is with sexual stimulation. Occasionally full testosterone therapy does not relieve the headache and suboccipital pressure pain. The administration of 6,000 rat units of estradiol benzoate every fourth day in combination with the testosterone for two or three doses relieves the symptoms.

DR. BENJAMIN F. SIEVE, Boston: Dr. Werner and his associates have emphasized that the cessation of menstruation in the woman is a side phenomenon that necessarily must occur at this time. However, in my experience the climacteric syndrome may precede by years the cessation of menstruation. Therefore one has to define and diagnose rather obscure symptoms to determine the onset of the climacteric syndrome in both the female and the male. In the female the cessation of menstruation is solely the indication of the termination of the reproductive period. I agree with Dr. Werner in that the male climacteric syndrome is a clinical entity which we are now able to diagnose and correct. In my experience the average age of onset is in the early forties. Many cases are seen early, in the third decade of life. Since external influences, particularly on the nervous system, seem to precipitate the onset of the syndrome, it is most likely that as a consequence of the war with all its ramifications many more early cases will be seen from now on. Aside from the androgens, the estrogens have also an important role in the therapy of the male syndrome. The role of the vitamin B complex therapy in the female and male syndrome is not fully understood at present. It seems that the vitamin B complex enhances the synthesis of the hormones.

DR. AUGUST A. WERNER, St. Louis: Fatigue and lassitude are symptoms common to hypothyroidism, but they are also common to the climacteric syndrome, without hypothyroidism, and they disappear on treatment with testosterone and without thyroid medication. It is known that the male and female secrete both estrogenic and androgenic hormones, but in the female the estrogenic hormone preponderates and in the male the androgenic hormone is in the ascendancy. I can see no reason for complicating the treatment of these conditions in the man or the woman. One cannot go far wrong by using nature's method, by giving the woman estrogens and the man androgens. However, there is one caution to be observed in giving the man androgens, and that is the condition of his prostate. If the prostate is large or is giving some trouble, estrogens are indicated. This is one example of where good medical and clinical knowledge and intelligence are needed. No potent drugs should be purchased over the drug counter for self medication. Dr. Sieve spoke about these symptoms occurring in the third decade. This syndrome can occur during any period of active sexual life, from puberty to the postclimacteric. If a young girl has her ovaries removed she will be disturbed by glandular-autonomic nervous system imbalance, irregularly, until past the time for the natural menopause to occur. Also if a girl begins to menstruate at the age of 14 years and to the age of 20 her menstruation is of four to five days' duration and the flow is good, and then she begins to flow less or scantily she will develop the climacteric symptoms even though she has cyclic bleeding. She is not in the menopause, but she has ovarian hypofunction from one of the various causes. The menstrual disturbance is only evidence of the glandular imbalance, and the glandular autonomic system imbalance causes the symptoms. Similarly, while the male does not have the visible evidence of gonad hypofunction that the female has, if his gonads hypofunction he develops the same glandular-autonomic imbalance and the characteristic symptoms.

Clinical Notes, Suggestions and New Instruments

BULLOUS DERMATITIS (DERMATITIS MEDICAMENTOSA) FROM PENICILLIN

GEORGE E. MORRIS, M.D.,
AND
JOHN G. DOWNING, M.D.
BOSTON

Reactions from penicillin may be due to the drug itself or they may arise from toxic impurities contained in individual batches of the extract. Those due to impurities were more frequent before technical developments in culture and extraction produced purer products. Such reactions included chills, fever, headache, faintness, flushing of the face, eosinophilia and other pathologic conditions.¹ Urticaria,² fever, thrombophlebitis,³ gastrointestinal reactions,⁴ contact dermatitis⁵ and vesicular dermatitis⁶ have been reported as toxic manifestations to the penicillin itself. To our knowledge, bullous dermatitis (dermatitis medicamentosa) has not been previously reported from the drug.

R. A., a man aged 56, seen at the Brooks Hospital by J. G. Downing on May 25, 1944, had received 1,000,000 units of penicillin for a postoperative infection. Four days after the

Bullous dermatitis (dermatitis medicamentosa) due to penicillin.

last injection the patient had noted itching of the left hand and arm, and twenty-four hours later erythema and edema of the left hand, arm and left side of the body appeared.

On the sixth postinjection day there was tense pitting edema of the entire hand and forearm. These parts also showed erythema and multiple ruptured and unruptured bullae, filled with clear, thin, yellow fluid.

The left side of the face and trunk showed multiple wheals of various sizes.

The dermatitis persisted for four to five days and disappeared under bland therapy.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., Secretary.

PENICILLIN (See Supplement to New and Nonofficial Remedies, 1944, p. 18).

The following dosage forms have been accepted:

CHEPLIN LABORATORIES, INC., SYRACUSE, N. Y.

Penicillin Sodium Salt: 20 cc. vials containing 100,000 Oxford units.

HEYDEN CHEMICAL CO., NEW YORK

Penicillin Sodium: 100,000 Oxford units.

ELI LILLY & CO., INDIANAPOLIS

Penicillin (Sodium Salt): Ampuls of 100,000 Oxford units.

WYETH INCORPORATED, PHILADELPHIA

Penicillin Sodium: Vipules of 100,000 Oxford units.

Penicillin Calcium: Vipules of 100,000 Oxford units.

BENZESTROL—Nonproprietary designation for 2,4-di-(p-hydroxyphenyl)-3-ethyl hexane, formerly known as Octofollin (see THE JOURNAL, March 4, 1944, p. 647).

The following dosage forms have been accepted:

LEDERLE LABORATORIES, PEARL RIVER, N. Y.

Solution Benzestrol (in Sesame Oil) 5 mg. per cc.: 2 cc. vials. Preserved with 0.5 per cent chlorobutanol.

Tablets Benzestrol: 2 mg. and 5 mg.

DIPHTHERIA TOXOID, TETANUS TOXOID, ALUM PRECIPITATED, COMBINED (See New and Nonofficial Remedies, 1944, p. 563).

The following dosage form has been accepted:

PARKE, DAVIS & CO., DETROIT

Diphtheria Tetanus Toxoid (Combined) Alum Precipitated: 1 cc. vial. Preserved with 0.01 per cent merthiolate.

SULFADIAZINE (See New and Nonofficial Remedies, 1944, p. 178).

The following dosage forms have been accepted:

BUFFINGTON'S, INC., WORCESTER, MASS.

Tablets Sulfadiazine: 0.5 Gm.

CARROLL DUNHAM SMITH PHARMACAL CO., ORANGE, N. J.

Sulfadiazine Tablets: 0.5 Gm.

SULFATHIAZOLE (See New and Nonofficial Remedies, 1944, p. 191).

The following dosage form has been accepted:

CARROLL DUNHAM SMITH PHARMACAL CO., ORANGE, N. J.

Tablets Sulfathiazole: 0.5 Gm.

SULFAPYRIDINE (See New and Nonofficial Remedies, 1944, p. 188).

The following dosage form has been accepted:

CARROLL DUNHAM SMITH PHARMACAL CO., ORANGE, N. J.

Tablets Sulfapyridine: 0.5 Gm.

SULFANILAMIDE (See New and Nonofficial Remedies, 1944, p. 184).

The following dosage form has been accepted:

CARROLL DUNHAM SMITH PHARMACAL CO., ORANGE, N. J.

Tablets Sulfanilamide: 0.32 Gm.

SULFAMERAZINE (See Supplement to New and Nonofficial Remedies, 1944, p. 10).

The following dosage form has been accepted:

ELI LILLY & CO., INDIANAPOLIS

Tablets Sulfamerazine: 0.5 Gm.

SANITARY DANGERS OF CROSS
CONNECTIONS IN PLUMBING

Sanitary engineering practice has recognized for many years the hazards attached to the current operation of public water supply systems. The design and construction of an integrated public water supply system guarantee only the essentials of good hydraulic and sanitary practice. After the completion of the system, however, many problems arise because of the nature of the liquid handled and of the physical laws governing its distribution. The system operates under varying conditions of starting and stopping and with thousands of exposures through plumbing installations attached for maximum public, private and industrial uses. These innumerable outlets and interconnections are essential not only for potable water use but for many of the sanitary equipments operated in a water carriage system. No matter how well conceived a water supply system may be, physical relation to nonpotable liquids may result from many of the uses in a modern community. Control of these many collateral uses is one of the most difficult functions of public service. Rarely does a comprehensive system prevent or eliminate the many cross and back siphonage connections which are in existence or which may be continually made.

The Chicago amebic dysentery epidemic in 1933 dramatized the problems attached to the consistent delivery of safe water. This epidemic emphasized the thinness of the dividing line between safety and danger where water supply is exposed to sewage contamination at the points of consumer use. Before and after that nationwide epidemic, sanitary engineers have been confronted with hundreds of epidemics of similar nature. Some indication of the widespread existence of cross connection and back siphonage hazards may be obtained from the accompanying summary of distinct violations of sanitary principles for the protection of water supply lines, as they appear from the records of one large port city. The conditions were found in the 1942-1943 period.

These conditions can be matched in virtually every city in this country. The cross connections are not usually the result of carelessness or poor design but are generally made for stand-by fire protection, for industrial water use, for pump priming or for auxiliary boiler feed.

Reports and recommendations on the subject have been prepared by the American Water Works Association, the New England Water Works Association, the Conference of State Sanitary Engineers and other interested groups. In a comprehensive review¹ of a seven year period ended in 1936 in the United States, Wolman and Gorman state that of 170 reported water borne outbreaks 14 were due to cross connections with a polluted water supply. A preliminary tabulation of disease outbreaks conveyed through water in the United States in 1942, as reported to the U. S. Public Health Service by state and territorial health authorities, indicates that 8 of 50 reported water borne outbreaks were due to cross connections with a polluted water supply.

Violation of Sanitary Principles for Protection of
Water Supply

Number of industrial plants and military establishments.....	319
Cross connections with nonpotable water supplies.....	331
Process water connections.....	2,861
Sewer connections (to water supplies).....	627
Back siphonage connections with plumbing systems.....	6,777
Back siphonage connections (miscellaneous).....	3,365
Pierhead connections (unequipped with protective devices).....	1,115
Total	15,076

Although great progress has been made in eliminating cross connections in the past two or more decades, many thousands of them unquestionably have been broken through cooperative action and through passage and enforcement of cross connection regulations. Some of these regulations have been adopted by many states. Numerous local water and health departments (e. g. Los Angeles) have also adopted rules and regulations. Enforcement often falls far behind the establishment of control procedures. State health agencies usually do not have the personnel to carry out the detailed and continuous follow-up necessary. Local water or health agencies may shirk their responsibilities and fail to carry out the necessary detailed surveys and subsequent reappraisals of conditions. Finally, it must be conceded that, even with conscientious attempted supervision, new cross connections or concealed connections may give trouble.

Back siphonage connections between potable water supply lines and plumbing systems may actually admit sewage to water lines under certain hydraulic conditions. In hospitals, equipment may be used with submerged inlets and connections so installed that infectious or poisonous materials may be back siphoned into the

1. Annual Year Book, A. P. H. A. 20, No. 2; J. A. W. W. A. February, 1940.

potable water supply pipes. Submerged inlets to factory process tanks holding poisonous solutions may result in contamination of the potable water supply, should back siphonage occur. Opportunities for sabotage may exist because of backflow of dangerous solutions in industrial plants.

During the war all of these hazards have unquestionably been increased by the large and rapid expansion in industry and in land and sea transportation. Breakdown in supervision by local, state and federal agencies has been too common. Many of the principles and standards regulating practice in this field were being abrogated in one direction or another during wartime. Such accidents became so frequent both on land and on sea that prompt review of the entire situation was essential in order to eliminate the detectable hazards and to prevent future disabilities. With this objective in mind the Committee on Sanitary Engineering² of the Division of Medical Sciences, National Research Council, created a Temporary Subcommittee³ on Cross Connections to review the rules and regulations promulgated by military, semimilitary and civilian agencies, to recommend modifications in policies and in practice and to make those conclusions and recommendations available to the country at large for application by military and civilian medical officers of health and engineers. This report has now been released by the Committee on Sanitary Engineering, with the approval of the National Research Council and the Surgeons General of the Army, the Navy and the U. S. Public Health Service. Exact figures of the number of persons made sick or exposed to disease outbreak during the last two years are missing in many instances. A review by the committee, however, indicates that at least some 100,000 persons have become ill.

One of the special problems to which the committee directs attention is pierhead connections installed to supply vessels with potable water for drinking or for fire fighting. These provide a ready method of polluting the potable water through the use of auxiliary fire pumps for nonpotable water. In one port city the number of these pierhead connections aggregates 15,000, and protective devices were necessary on some 2,500. The report represents a number of methods of prevention of backflow into potable water systems. All of them are adjusted to the availability of wartime materials and to the increased necessities for physical protection as a necessary supplement to personal supervision. The report should be read by every medical officer of health, every sanitary engineer and every waterworks official engaged in the protection of the potable water supply. Many officials even at this late date are not yet aware of the significance of these concealed hazards.

² The members of the Sanitary Engineering Committee are Harold E. Hahutt, F. C. Bishop, V. M. Ehlers, Gordon M. Fair, Kenneth F. Maxey, H. A. Whittaker and Abel Wolman, chairman.

³ The members of the Temporary Subcommittee on Cross Connections are E. Sherman Chase, Joel I. Connolly, Francis M. Dawson, Raymond F. Gouley, Sol Pincus and Warren J. Scott, chairman.

RETARDATION OF BONE GROWTH

The problem of equalization of the length of the legs arises in children and in young adults as the result of the healing of overriding fractures, injuries to the adjacent epiphysis from joint or bone infection, bone tumors and congenital deformities. In many cases unequal length occurs as a residual effect of paralysis of muscle groups attendant on anterior poliomyelitis. The methods employed for equalization of length consist in lengthening the short limb,¹ shortening the long limb,² arresting the bone growth of the longer extremity by destroying the epiphysal cartilaginous plate³ and stimulating bone growth of the shorter limb by lumbar sympathectomy⁴ or by direct irritation of the epiphysal cartilaginous plate.

In a series of experiments on dogs, in which an attempt was made to stimulate bone growth by inserting two different kinds of metal into and around the epiphysal plate. Haas⁵ observed that in 1 animal in which a free wire loop was placed around the epiphysal plate in the frontal plane the wire loop opened as growth took place and the epiphysis grew distally. Comparison of the two extremities at the conclusion of the experiment indicated that there was a loss of growth in the limb with the wire loop. Haas repeated the experiment on a number of dogs and became convinced that longitudinal growth of bone could be mechanically hindered by passing a wire loop around the epiphysal plate to bind the epiphysis to the diaphysis. The method was employed in treating 2 patients with discrepancy in the length of the legs resulting from poliomyelitis. A stainless steel wire was passed through the epiphysis and the ends were turned proximally. A similar wire was passed through the metaphysis and the ends were turned distally. The two wires were then hooked together under tension. From March 4, 1941 to July 12, 1944 there had been 1.3 cm. more growth on the short than on the normal side. The operation was performed on 5 patients.

Haas points out that determination of the practicality of this method to control bone growth must await the results obtained after a long period, since growth is relatively slow in man. However, growth of bone can be controlled by alternately releasing or tying the wire loops. The method presents a theoretical advantage over resection of the epiphysal plate because its effect is only temporary.

ADENOSINE TRIPHOSPHATE

Investigators of intermediary metabolism have shown that the apparently simple combustion of carbohydrate in the body is in reality a complex phenomenon. Much of the newer knowledge has been secured by using thin slices of living tissue as the metabolizing system. Then a still simpler scheme involved the use of purified enzymes, so that the steps of the reactions could be examined in detail. As a result the classic Embden-Meyerhof-Parnas mechanism for the utilization of carbohydrate by tissues was evolved. In comparing the various suggested outlines, it is obvious that phosphate plays an important role in the combustion of glucose; either the esterification of the carbohydrate with phosphoric acid or the hydrolysis of such esters is involved in many of the reactions. Some of these esters possess large amounts of energy which is available in metabolism; such phosphorus linkages have been called the "high energy phosphorus bond" by Lipmann.¹ Adenosine triphosphate possesses a high energy bond which is lost in the course of the phosphorylation of glucose prior to its enzymatic conversion to glycogen or its oxidation for muscular energy and heat. The regeneration of the adenosine triphosphate appears to be associated with the aerobic oxidation of pyruvic acid.

Experimental support for the foregoing view is afforded by the results of studies by Kaplan and Greenberg,² who observed that the adenosine triphosphate in the liver is decreased on dietary regimens in which impairment of glucose tolerance might be expected. Thus in rats a high fat ration or inanition produces not only a diabetic type of glucose tolerance curve but also a reduction of adenosine triphosphate in the liver. Injection of glucose, however, increases the hepatic adenosine triphosphate, which is to be expected, as aerobic oxidation of glucose is coupled with the regeneration of energy rich phosphate compounds.

Insulin increases the adenosine triphosphate in the liver even if the animals are consuming a high fat diet, possibly through the aerobic oxidation of pyruvic acid. This augmentation of oxidation of pyruvate may be the fundamental point of action of insulin in carbohydrate metabolism, for it is known that both in vitro synthesis of glycogen and the enzymatic degradation of glucose can occur without the intervention of insulin or other hormones. The foregoing observations on the significance of phosphorus in the metabolism of carbohydrate are of added interest because of the suggested mode of action of insulin. The present clinical significance of this hormone justifies continued investigation of the details of its behavior in metabolism.

Current Comment

NODULAR PERINEURITIS AND POLYMYOSITIS IN RHEUMATOID ARTHRITIS

Freund and his co-workers¹ in Detroit described distinctive inflammatory nodules in the perineurium of peripheral nerves in rheumatoid arthritis. Such lesions may occur in nerves more or less remote from affected joints as well as in nerves not connected with joints. In a study of the nerves in the amputated legs of a 27 year old woman suffering from rheumatoid arthritis, nodular lesions of a similar nature were found² also in large numbers in the skeletal muscles. The lesions varied in size from microscopic to visible by the naked eye on stained sections of muscle. They were made up of lymphocytes, relatively few plasma cells and occasional epithelioid and eosinophilic cells, but giant cells or necrotic centers were not found. In some nodules on nerves there was a central necrosis. Such nodules were found also in biopsies of muscle in 14 cases of rheumatoid arthritis but not in any of many control examinations. The exact relation of the muscle lesions to small blood vessels or to nerves has not been determined. The muscle fibers themselves presented irregularly distributed degenerative and atrophic changes. The Detroit investigators regard these nervous and muscular lesions as specific and as indicative of the systemic nature of rheumatoid arthritis. The joint involvement is associated with a widespread nodular lymphocytic inflammation in peripheral nerves and skeletal muscles, which serves to explain the pain, tenderness and trophic changes of the disease at the same time as it presents a new point for investigative attack on the problems of etiology. Whether the neural and muscular nodules contain the causative agent is a question which invites experimental investigation.

PENICILLIN RESISTANCE

Strains of bacteria resistant to penicillin may be obtained experimentally by growing bacteria on mediums containing increasingly higher concentrations of the drug. Experiments by Demerec¹ indicate that the resistance of a strain of *Staphylococcus aureus* to certain concentrations of penicillin is not due to an interaction of penicillin on the bacteria but rather that it arises independently in the bacteria by mutation. In any large population of bacteria of the staphylococcus strain used there is some individual resistance to certain low concentrations of penicillin. The nonresistant organisms are eliminated, while the more resistant survive. Penicillin acts as a selective agent but it does not itself increase the resistance of the survivors. Resistance is a complex characteristic of the bacteria which involves a number of mutations and a multiplicity of genic changes.

MEDICINE AND THE WAR

ARMY

THE ARMY'S RECONDITIONING PROGRAM

Soldiers recovering from battle wounds are making up credits toward obtaining high school and college diplomas while in convalescent hospitals, as part of the Army's reconditioning program. The curriculum offered by the program includes music, printing, automotive mechanics, business and army administration, electricity, photography, carpentry, pattern making, watch repairing, metal working, lettering and sign writing, welding, canvas and leather working and drafting. Patients are not held in army hospitals to complete any course of study. When they have reached the maximum benefit of hospitalization they are returned to duty.

Wounded soldiers, now being evacuated from overseas at the rate of more than 33,000 a month, first are sent to one of sixty-four general hospitals best suited for the special type of treatment required. When a patient has recovered sufficiently and no longer requires daily ward care, he is removed to a convalescent hospital.

A. A. F. RHEUMATIC FEVER CONTROL PROGRAM

The second conference of the A. A. F. Rheumatic Fever Control Program was recently held at the A. A. F. Regional Hospital of the San Antonio Aviation Cadet Center. The conference was attended by more than 150 medical officers representing all branches of the armed forces. Symposiums on rheumatic fever, respiratory disease and air borne infections were presented. The following are the major recommendations of the various committees which met during the conference:

Committee on Sulfonamide Prophylaxis: This measure should be used cautiously and only after other measures to control respiratory disease have been utilized to the full.

Committee on Streptococcus Grouping and Typing: Methods were standardized in all laboratories for this procedure. There are now sixteen special streptococcus laboratories in A. A. F. regional hospitals.

Committee on Treatment of Upper Respiratory Infection: Further well controlled studies with sulfonamides and penicillin are advisable before any therapeutic recommendations can be made.

Committee on Salicylate Therapy: Studies were outlined for the use of salicylates prophylactically and therapeutically. It was recommended that intravenous salicylates are unnecessary, as satisfactory blood levels are obtainable by oral therapy.

Committee on Convalescent Care: Studies of physical fitness and attempts to determine the termination of active rheumatic infection should be continued.

A DISTINGUISHED MEDICAL DETACHMENT

An enviable record has been made by the medical detachment of the 16th Infantry Regiment of the 1st Infantry Division, which has been in action since it landed at Oran, Algeria, Nov. 8, 1942. It has also participated in the Tunisian, Sicilian, Normandy, French, Belgian and German campaigns, participating in the D day landings at Oran, Sicily and Normandy. In the latter landing operation the regiment was awarded the Presidential Distinguished Unit Badge. Officers and men of this medical detachment have to date been awarded 4 Distinguished Service Crosses, 90 Silver Stars, 1 Legion of Merit, 128 Bronze Stars and 159 Purple Hearts. Major Charles E. Tegtmeyer of Hamilton, N. Y., is in command of the unit and is the recipient of each of the five awards mentioned. The men of the unit take pride not only in the excellence of their first aid work but also in their ability to evacuate the seriously wounded expeditiously under fire.

CASUALTIES FROM OVERSEAS

In a recent announcement the War Department stated that army general and convalescent hospitals in this country are caring for more than 50,000 more sick and wounded soldiers than was the case three months ago. The number of patients had jumped from around 87,000 last October to 140,000 by the end of January and is steadily increasing. According to the Office of the Surgeon General each of these men will be sent to an army general hospital where there is a specialized treatment center for his particular type of injury or illness. These "centers" are staffed with specialists in plastic surgery, tropical diseases and other specialized fields. They are also equipped with the finest treatment facilities.

Brig. Gen. Raymond W. Bliss, Assistant Surgeon General, stated that the present expansion of general hospitals by 70,000 beds was being rapidly accomplished through the conversion of existing general hospitals rather than through the construction of new wards. At many of the general hospitals, he said, there are well constructed barracks, built with an eye to the future, which were used to house overseas hospital units during their training period. The barracks are now being turned into wards for patients. Permanent barracks, built to house the hospital staff, are also being converted into wards, and these are being replaced with temporary barracks, which can be quickly constructed.

The number of bed patients who can be cared for in army general hospitals has been further increased by the establishment of more convalescent centers where patients are sent as soon as they are up and about. There are now eleven of these where soldier patients are being reconditioned in a pleasant club-campus atmosphere for return to duty or to civilian life.

This reconditioning program keeps the men active physically and mentally during their convalescence. It has recently been expanded to include vocational guidance and a wider variety of technical, business and art courses which enable the men to develop new interests and skills while they are still patients.

DESIGN NEW DRESS FOR WAC HOSPITAL TECHNICIANS

The Army Quartermaster Corps has developed and is now procuring a new, short sleeved dress of rose beige cotton print resembling chambray for members of the Women's Army Corps who receive special medical and surgical technician training and are assigned as technician aides to army medical officers and nurses. The new dress for Wacs in hospitals, which will replace the present blue cotton-cape uniform, is tailored in one piece, fastens down the front with buttons to match its color and has a buttoned belt. The insignia are worn on the collar, the U. S. on the right and the caduceus on the left tab. Each enlisted WAC technician will be issued nine of these easily laundered dresses. They are for wear only while on duty in the hospital and will not be worn by officers.

CHANGE DDT SPECIFICATIONS

The War Department recently announced that specifications of DDT spray, developed by the Quartermaster Corps to control roaches, flies, mosquitoes, bedbugs, ants and other insects, have been changed to eliminate the tendency of the spray to crystallize at low temperatures. The spray, which is a saturated solution of DDT in kerosene, crystallized to some extent when held in unheated storage. By adding 15 per cent of a special methylated naphthalene to the kerosene a solution showing no crystallization at temperatures as low as 20 degrees below zero was obtained.

RECONDITIONING THE MIND SPEEDS SOLDIER CONVALESCENCE

According to Col. Augustus Thorndike, director of the Reconditioning Consultants Division, Office of the Surgeon General, reconditioning the mind, supplementing reconditioning the body, is the newest ally to obtain rapid convalescence. Major W. S. Briscoe, who is in charge of the program, stated that the task of the educational reconditioning program is to return the soldier, either to active army service or to civilian life, mentally alert. Under this program mental activities gradually increase as the soldier's needs for physical reconditioning from his injury taper off. Class 4 patients (confined to bed) have at first merely simple entertaining types of activity that will help them overcome and forget their anxieties about their injury and their future. As they become class 3 patients (up and about but still confined to hospital wards) their mental reconditioning program is stepped up. Men who wish to continue their formal education—stopped by their induction into the Army—are encouraged to take correspondence courses from the United States Armed Forces Institute at Madison, Wis. When the casualty reaches the status of a class 2 patient and no longer needs medical care in a ward, he is given a uniform and becomes a "trainee." He leaves the hospital and is assigned to a reconditioning center, where he lives in army barracks and begins the task of fitting himself for either active or limited duty, according to his disability. Finally, as a class 1 convalescent the soldier patient finds his physical and educational reconditioning increased. He takes drill and other military subjects, and he relearns some of the early lessons of his basic training.

The main idea of the educational reconditioning program is to return the casualty to army duty as quickly as possible, in the best physical condition and mentally as good as or better than before his injury. The same ideal is sought if the soldier is going eventually to return to civilian status.

NEW LIGHTWEIGHT ARTIFICIAL LEG

The War Department stated recently that an improved artificial leg, made of light metals, plastic or fiber, will shortly be made available to amputees of the Army. The new prosthesis is the result of study and recommendations made by the National Research Council, National Bureau of Standards, artificial limb manufacturers, scientists, army and navy surgeons and the Veterans Administration and will be standardized for use by the Army. It provides the best innovations and improvements of the custom built leg now in use, and the important factors studied were interchangeability of parts, light weight, quality and strength of materials.

A cast aluminum knee joint for above the knee legs, consisting of knee block and shin section, and a cast aluminum ankle assembly, consisting of shin and foot sections, have been adopted. Both are to be produced in quantity as soon as the necessary modifications can be made for bonding to metal, plastic or fiber. Joints have been carefully tested by the Bureau of Standards, and specifications provide for the best available metal and finish.

A complete assortment of the various parts that go into an artificial leg will be made available to amputation centers so that each center will be able to continue the policy of making custom built legs in each amputation case.

WOMEN IN ARMY MAY ASK FOR U. S. ASSIGNMENT

In a recent announcement from the War Department it was stated that theater commanders are authorized to return for duty in the United States any woman officer, woman warrant officer or enlisted woman, on her request and presentation of satisfactory evidence that her husband has been returned from permanent overseas assignment with the armed forces to the United States for reassignment, hospitalization or honorable discharge. The new ruling, which applies only to women overseas, is in addition to an older policy with regard to married members of the Women's Army Corps whose husbands have been discharged for medical reasons.

ARMY AWARDS AND COMMENDATIONS

Major Albert B. Smith

The Legion of Merit was recently awarded to Major Albert B. Smith, formerly of Norwich, N. Y. The citation states, in part, "Working with medical units that had never made a landing behind enemy lines, Major Smith trained and organized these units to the extent that on D day, during the landing on Anzio, casualties were treated and evacuated with great speed and dispatch. He directed the establishment of the first permanent cemetery on the beachhead and personally supervised the speedy collection and burial of the dead. When given the duties as post surgeon in Anzio he established contact with all other medical units in the area, both British and American, and planned his medical service so that large numbers of casualties from both land and sea were treated and evacuated in a very efficient manner. Given the responsibility of supervising conditions inside Anzio, he arranged for the immediate elimination of mosquito breeding points, the cleaning of buildings, enforcement of antimalaria measures . . . for the protection of all troops in the city. Major Smith's services were invaluable in maintaining the health and safety of troops stationed in the city of Anzio." Dr. Smith graduated from McGill University Faculty of Medicine, Montreal, in 1938, was commissioned a first lieutenant in September 1939 and was called to active duty in November 1940.

Colonel Francis Brown Berry

The Legion of Merit was recently awarded to Col. Francis Brown Berry, formerly of New York City, "for exceptionally meritorious conduct during the North African campaign." The citation in part stated that "during the operation of the hospital (9th Evacuation) in the Tebessa area in North Africa from Jan. 22 to Feb. 17, 1943, . . . when the enemy broke through at Kasserine Pass and it became necessary to move back the hospital on short notice, Lieutenant Colonel Berry quickly organized and directed a system of detailing parts of the hospital to set up in the rear and admit the 363 patients remaining in the hospital, many of whom were seriously wounded and could not stand the long trip necessitated by existing lines of evacuation. His organizing ability and surgical judgment were reflected directly in the medical record and contributed substantially to the morale and confidence of the combat troops in that area." Dr. Berry graduated from Harvard Medical School, Boston, in 1917 and entered the service May 10, 1942.

Lieutenant Colonel Bert Bradford Jr.

The Bronze Star has been awarded to Lieut. Col. Bert Bradford Jr., formerly of Charleston, W. Va., for meritorious service in Belgium. Dr. Bradford has been attached to an evacuation hospital overseas since the summer of 1943 and has seen service in England, France and Belgium. He graduated from Washington University School of Medicine, St. Louis, in 1935 and entered the service March 28, 1941.

Major Victor E. Nelson

Major Victor E. Nelson, formerly of Detroit, has been awarded the Purple Heart and the Bronze Star with cluster and has two citations for bravery under fire. Dr. Nelson graduated from the University of Michigan Medical School, Ann Arbor, in 1932 and entered the service Nov. 10, 1942.

Lieutenant Colonel Jack F. Burnett

Lieut. Col. Jack F. Burnett, formerly of Ennis, Texas, was recently awarded the Bronze Star for meritorious service as flight surgeon with a unit in China. Dr. Burnett graduated from the University of Oklahoma School of Medicine, Oklahoma City, in 1939 and entered the service Oct. 1, 1940.

Captain F. C. Winskunas

The Bronze medal for bravery and efficiency was recently awarded to Capt. F. C. Winskunas, formerly of Chicago. Dr. Winskunas graduated from Loyola University School of Medicine, Chicago, in 1932 and entered the service Oct. 21, 1942.

NAVY

NAVY AWARDS AND COMMENDATIONS

Rear Admiral William Chambers

Rear Admiral William Chambers, who served as inspector, Medical Department Activities, Pacific Area, from October 1942 to Aug. 1, 1944, was recently awarded the Distinguished Service Medal. He is now medical officer in command, National Naval Medical Center, Bethesda, Md. The citation read "for exceptionally meritorious service to the government of the United States in a duty of great responsibility as inspector, Medical Department Activities, Pacific Area, from October 1942 to Aug. 1, 1944. Working tirelessly and with brilliant administrative skill, Rear Admiral Chambers carried out his vital assignments throughout the combat areas of the South, Southwest and Central Pacific, expeditiously effecting the organization of medical facilities which included first aid treatment in the field, hospitalization and evacuation of the sick and wounded, the establishment of medical storehouses and supply depots for the fleet and shore activities and the preliminary plans for care of natives in conquered territory. A qualified flight surgeon, he personally participated in the evacuation of the first battle casualties from Bougainville prior to the organization of a regular air evacuation service and later, by his unwavering efforts and excellent judgment during our operations in the Marianas Islands, contributed materially to the saving of a large number of lives. Consistently applying his superior professional knowledge efficiently and with outstanding resourcefulness, Rear Admiral Chambers distinguished himself as a forceful leader and was largely responsible for the success of the Medical Department's program in this theater of war." Dr. Chambers graduated from Jefferson Medical College of Philadelphia in 1907 and entered the service April 6, 1908.

Captain George M. Lyon

Capt. George M. Lyon, now on special assignment at the Naval Hospital in Philadelphia, was recently awarded the Bronze Star "for meritorious performance of duty as chemical warfare officer on the staff of commander, United States Naval Forces in Europe, during the period August 1942 to September 1944. Captain Lyon, by his force of character, industry, intense interest and special knowledge in the field of chemical warfare, has been largely responsible for the development—not only in the Medical Department but in all departments—of an appreciation and understanding of the possibilities of chemical warfare. He was chiefly responsible for the training in defense against chemical warfare of the naval forces organized in the United Kingdom for the assault on North Africa and more recently organized the program of instruction for all naval personnel engaged in the operations against the coast of France. As a result of this indoctrination the naval forces involved were prepared to a very high degree to take proper measures if they had been confronted with the use of chemical agents. By his individual effort he has established and maintained liaison with all branches of the services and civilian agencies which were doing investigative work in this field in the United Kingdom and as a result has transmitted much valuable information to the Navy Department. The imaginative professional ability and unselfish devotion to duty displayed by Captain Lyon during this period were in keeping with the best tradition of the United States naval service." Dr. Lyon graduated from Johns Hopkins University School of Medicine, Baltimore, in 1920 and entered the service April 10, 1942. Dr. Lyon is a member representing the American Medical Association on the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association.

Lieutenant Floyd Glenn Warrick

The Legion of Merit was recently awarded to Lieut. Floyd Glenn Warrick, formerly of Glendale, Calif., "for exceptionally meritorious conduct in the performance of outstanding service to the government of the United States as assistant battalion surgeon and later as battalion surgeon prior to and during the operations against enemy Japanese forces on Tarawa Atoll, Gilbert Islands, Nov. 20 to 24, 1943. Exercising sound judgment

and superior professional knowledge, Lieutenant (then Lieutenant, Junior Grade) Warrick expeditiously trained the personnel and prepared the plans of the medical section for the attack on this highly strategic island. When his battalion surgeon was killed during the ensuing action he promptly established an aid station in the cove area of the North Beach of Betio Island and, working tirelessly and with expert skill for three days and nights under extremely hazardous conditions, efficiently supervised the treatment of numerous casualties and all medical activities in the area. By his cool courage and tenacious devotion to duty in the face of grave peril, Lieutenant Warrick was responsible for the saving of many wounded marines who otherwise might have perished." Dr. Warrick graduated from the University of Nebraska College of Medicine, Omaha, in 1938 and entered the service Dec. 21, 1942.

Lieutenant (Junior Grade) Ralph C. Pollock Jr.

The Navy and Marine Corps Medal was recently awarded to Lieut. (jg) Ralph G. Pollock Jr., formerly of St. Louis. The citation read "for heroism while serving as medical officer of a Marine infantry battalion in action against the enemy on the island of Saipan, Marianas Group, on June 15, 1944. While the battalion was under heavy mortar fire and numerous casualties were suffered, Lieutenant Pollock, at great risk to his life and with utter disregard for his own safety, moved from one to another and treated at least fifteen wounded Marines. Despite the heavy mortar fire, Lieutenant Pollock administered this aid without the assistance of a corpsman and relieved the suffering and saved the lives of many Marines. His actions during a crucial phase of the attack were an inspiration to all and did much to bring order out of the confusion of a hotly contested beachhead and were in keeping with the highest traditions of the United States Naval Service." Dr. Pollock graduated from Stanford University School of Medicine, San Francisco, in 1941 and entered the service Sept. 7, 1943.

Commander Martin Van Brown

Under Secretary of the Navy Ralph A. Bard recently presented the Bronze Star to Comdr. Martin Van Brown, formerly of Carbondale, Ill., and now on duty as executive officer of the Hospital Corps School for members of the Women's Reserve, at the Naval Medical Center, Bethesda, Md. The citation accompanying the award read "for heroic achievement as medical officer attached to a warship during the assault and capture of an enemy Japanese held island in the Pacific war area on July 24, 1944. Cool and courageous under hostile fire, Commander Brown rendered gallant service throughout this hazardous operation and, although painfully wounded, continued at his post of duty for twelve hours administering medical care to casualties aboard. His skill and inspiring conduct were in keeping with the highest traditions of the United States naval service." Dr. Brown graduated from the University of Illinois College of Medicine, Chicago, in 1931 and entered the service June 18, 1930.

Captain Vincent Hernandez

The Bronze Star was recently presented to Capt. Vincent Hernandez of Washington, D. C., the citation accompanying the award reading "for meritorious achievement as force medical officer on the staff of Commander Air Force, United States Atlantic Fleet, from June 1943 until January 1945. Skillfully coordinating the work of medical officers of the Air Force, Atlantic Fleet, with that of naval air stations basing fleet aviation units, Captain Hernandez organized and supervised the activities of the officers under his jurisdiction and, by his untiring efforts and painstaking attention to particular needs, effected measures to insure the physical fitness, endurance and resistance of flying and maintenance personnel engaged in the widespread battle of the Atlantic. His exceptional success in this vital service reflects the highest credit on Captain Hernandez and the United States Naval Service." Dr. Hernandez graduated from Georgetown University School of Medicine, Washington, in 1918 and entered the service Sept. 10, 1921.

PROCUREMENT AND ASSIGNMENT SERVICE FOR PHYSICIANS, DENTISTS AND VETERINARIANS

The following data are to be noted in extension of the revised selective service deferment policy as published in *THE JOURNAL*, March 10:

1. Students are not included in these procedures.
2. Members of medical faculties who hold degrees other than that of doctor of medicine, such as Ph.D., do not come under the jurisdiction of the Procurement and Assignment Service.
3. This work should be completed by April 1 if protection is to be assured to those it is necessary to protect.
4. In filling out forms 42-A for the group 30 through 37, it is necessary only to forward one copy rather than three copies to the registrant's local board.
5. These forms do not have a place for certification but in the case of the Procurement and Assignment Service, as differentiated from all other certifying agencies, similar endorsement should be inserted in spite of advices to the contrary which are based on the standard procedure for all other certifying agencies.

6. All men holding the degree of doctor of medicine in the groups affected require certification by the Procurement and Assignment Service, as well as all interns who do not receive their M.D. degree until completion of their internships.

7. It would be of considerable help to the Procurement and Assignment Service if the institutions would forward military record, if any, of the individual, such as "Applied for commission, physically disqualified on (date)." This could be attached as a notation to the forms.

8. State chairmen are being supplied with copies of form DSS-333, but it is not absolutely essential that such lists be filled out on standard forms. Lists on plain pieces of paper with the proper headings will serve satisfactorily and will not delay getting the information forwarded to the state chairman. Keep in touch with your state chairman in regard to further details and further directions from his office rather than from other sources.

MISCELLANEOUS

JOURNAL AND WAR MEDICINE NEEDED FOR FOREIGN LIBRARIES

Physicians wishing to donate back copies of *THE JOURNAL* (and/or *War Medicine*), issues from 1939 on, to help restock medical libraries of liberated countries in Europe may do so by sending this material to the Foreign Information Research Division, Office of War Information, 224 West 57th Street, New York 19, N. Y.

The Office of War Information, working in collaboration with our legations and embassies overseas, is discovering the urgent need of the medical profession abroad in terms of information that has been developed during the war period. Representatives in OWI outposts will make a distribution of donations.

WARTIME GRADUATE MEDICAL MEETINGS

The following subjects and speakers for Wartime Graduate Medical Meetings have just been announced:

New York

Induction Center, Grand Central Palace, New York: Report on Anesthesia Practices in the Present War, Dr. E. A. Rovenstine, April 6; Common Wartime Dermatoses, Dr. Frank C. Combes, April 13 (to be repeated on April 20); Common Allergic Manifestations, Dr. Joseph Harkavy, April 27.

Ohio

Crile General Hospital, Cleveland: Congenital Anomalies of the Genitourinary Tract, Dr. William E. Lower, April 24.

Pennsylvania

U. S. Naval Hospital, Philadelphia: Surgical Conditions Affecting the Knee Joint, Dr. Paul Colonna, April 6.

Virginia

Woodrow Wilson General Hospital, Staunton, Va.: Arterio-venous Fistula, Dr. William B. Porter, April 11.

A. A. F. Regional Hospital, Langley Field, Virginia: Psychosomatic Medicine, Dr. Solomon Katzenelbogen, April 27; Radiology, Dr. Frederick M. Hodges, April 27.

West Virginia

Newton D. Baker General Hospital, Martinsburg, W. Va.: Management of Plastic Surgery Problems in War, Dr. Edward A. Kitlowski, April 2; Clinic in General Surgery, Dr. William F. Rienhoff Jr., April 2; Psychosomatic Medicine, Dr. Claude L. Neale, April 16; Recent Developments in Nutrition, Dr. J. C. Forbes, April 16.

HOSPITALS NEEDING INTERNS AND RESIDENTS

The following hospitals have indicated to the Council on Medical Education and Hospitals that they have not completed their house staff quota allotted by the Procurement and Assignment Service:

(Continuation of list in *THE JOURNAL*, March 10, page 598)

COLORADO

Corwin Hospital, Pueblo. Capacity, 228; admissions, 4,628. Dr. Samuel B. Potter, Chief Surgeon (interns, July 1).

ILLINOIS

Englewood Hospital, Chicago. Capacity, 187; admissions, 5,693. Mr. A. R. Zeiter, Superintendent (5 interns, October 1).
St. Mary's Hospital, East St. Louis. Capacity, 276, admissions, 5,366. Sister M. Prosperia, R.N., Superintendent (interns).

KENTUCKY

Louisville General Hospital, Louisville. Capacity, 587; admissions, 9,971. Dr. John Walker Moore, Medical Director (residents—medicine, surgery, gynecology and obstetrics, pediatrics, disqualified for medical service).

MARYLAND

Maryland General Hospital, Baltimore. Capacity, 268; admissions, 4,977. Mr. Stewart B. Crawford, Superintendent (interns, July 1).
St. Agnes Hospital, Baltimore. Capacity, 277; admissions, 5,788. Sister Rosanna, R.N., Administrator (resident—surgery, July 1, disqualified for military service).
Sinai Hospital, Baltimore. Capacity, 347; admissions, 6,083. Mr. Harvey H. Weiss, Executive Director (resident—obstetrics, July 1, disqualified for military service).

NEBRASKA

Bishop Clarkson Memorial Hospital, Omaha. Capacity, 160; admissions, 4,662. Miss Cecelia Meister, R.N., Superintendent (interns).

NEW JERSEY

Muhlenberg Hospital, Plainfield. Capacity, 330; admissions, 6,319. Mr. John R. Howard Jr., Superintendent (4 interns, July 1).

NEW YORK

Cumberland Hospital, Brooklyn. Capacity, 400; admissions, 5,790. Dr. Max Seide, Medical Superintendent (3 interns, July 1).
Gouverneur Hospital, New York City. Capacity, 220; admissions, 3,221. Dr. O. I. Bloom, Medical Superintendent (3 interns, July 1).
Mother Cabrini Memorial Hospital, New York City. Capacity, 205, admissions, 3,212. Mother Corinna, R.N., Superintendent (interns).

OHIO

City Hospital, Akron. Capacity, 421, admissions, 10,909. Mr. Worth L. Howard, Administrator (2 residents—surgery, July 1, disqualified for military service).
Deaconess Hospital, Cincinnati. Capacity, 198; admissions, 4,377. Mr. William H. Frersing, Superintendent (4 interns, July and August).

PENNSYLVANIA

St. Joseph's Hospital, Pittsburgh. Capacity, 200, admissions, 4,507. Sister Anna Regina, Superintendent (interns, April 1, 1946).

TEXAS

Methodist Hospital, Dallas. Capacity, 225; admissions, 8,193. Dr. C. W. Senckenbach, Medical Director (interns).
St. Paul's Hospital, Dallas. Capacity, 300; admissions, 12,444. Sister M. Antonio, R.N., Superintendent (interns).

ORGANIZATION SECTION

Official Notes

ABSTRACT OF MINUTES OF MEETINGS OF BOARD OF TRUSTEES HELD FEBRUARY 15 AND 16, 1945

A two day meeting of the Board was held in the headquarters of the Association on Thursday and Friday, February 15 and 16, preceded by a full day meeting of the Executive and Finance Committee, during which careful consideration was given to the business of the Association.

INVESTMENTS

The first order of business was a review of the investment portfolio of the Association, and action was taken with respect to the purchase and sale of securities.

TEMPORARY SECRETARY FOR COUNCIL ON MEDICAL SERVICE AND PUBLIC RELATIONS

The Board authorized the employment on a part-time basis of Mr. Thomas A. Hendricks, executive secretary of the Indiana State Medical Association, to act as temporary secretary of the Council on Medical Service and Public Relations.

APPROPRIATIONS

Appropriations were made for the conduct of the various councils, bureaus, committees and departments of the Association, for exhibits, for the usual conferences and for scientific and therapeutic research.

BOARD OF TRUSTEES NEWS LETTER

The Board authorized the preparation in the headquarters office about twice a month of a news letter for circulation under the name of the Board of Trustees, with the approval of the Secretary of the Board and the Secretary and General Manager of the Association, to members of the House of Delegates, officers of the Association, officers of state medical societies and councils.

CANCELLATION OF ANNUAL SESSION OF ASSOCIATION

The Board confirmed its mail vote, which was unanimously in favor of canceling the annual session of the Association in 1945, and authorized the Secretary and General Manager to make application for a meeting of the House of Delegates to be held this year.

ELECTION OF DR. ROBERT A. PEERS TO BOARD OF TRUSTEES

The Board also confirmed its mail vote, which was unanimously in favor of the election of Dr. Robert A. Peers of Colfax, Calif., to serve as Trustee in the place of Dr. Edward M. Pallette (deceased) until the next meeting of the House of Delegates.

LEGISLATION

The Board approved the appointment of Dr. R. L. Sensenich and Dr. Victor Johnson to confer with representatives of the American Hospital Association with respect to the Hill-Burton Hospital Construction Bill when and if such a meeting is deemed necessary and to appear before the Senate Committee on Education and Labor when hearings on that bill are held.

The Board also approved the appointment of Dr. Walter Donaldson and Dr. Morris Fishbein to confer with two representatives each of the American Hospital Association and the Editors and Publishers Association for the purpose of developing a press code for hospitals.

REQUEST FOR SECTION ON PHYSICAL MEDICINE

The opinion of the Council on Scientific Assembly, to which a request from the Baruch Committee on Physical Medicine

was referred, to the effect that this request for a section on physical medicine should be referred to the House of Delegates, was approved by the Board.

MOVEMENT TO MINIMIZE TRAFFIC ACCIDENTS AND TO CONSERVE MANPOWER AND TRANSPORTATION FACILITIES

The Board expressed its willingness to cooperate to the fullest extent with the International Association of Chiefs of Police in its effort to decrease traffic accidents and to conserve manpower and transportation facilities, and instructed the Editor of THE JOURNAL to make editorial comment on this subject.

INCREASE IN RESERVE FUND

The reserve fund for machinery and equipment was increased, in view of the fact that it has been impossible to make necessary purchases along these lines since the beginning of the war and that present machinery and equipment is steadily wearing out or becoming antiquated.

APPOINTMENTS

The following appointments were made to editorial boards of special journals and to councils and committees (unless otherwise stated, the appointee succeeds himself):

American Journal of Diseases of Children, Dr. James L. Wilson; *Archives of Dermatology and Syphilology*, Dr. Paul A. O'Leary, Rochester, Minn., to succeed Dr. Charles C. Dennie; *Archives of Internal Medicine*, Dr. John H. Musser; *Archives of Neurology and Psychiatry*, Drs. Charles D. Aring and Louis Casamajor; *Archives of Ophthalmology*, Dr. W. L. Benedict; *Archives of Otolaryngology*, Dr. Chevalier Jackson; *Archives of Pathology*, Dr. Wiley Davis Forbus, Durham, N. C., to succeed Dr. Oscar T. Schultz, who resigned because of illness; *Archives of Surgery*, Drs. Waltman Walters and Walter E. Dandy; Council on Pharmacy and Chemistry, Drs. Morris Fishbein, Perrin H. Long, G. W. McCoy and Elmer M. Nelson; Council on Physical Medicine, Drs. A. U. Desjardins, Frank H. Krusen and H. B. Williams; Council on Foods and Nutrition, Dr. Morris Fishbein and Dr. A. Ashley Weech, Cincinnati, to succeed Dr. Irvine McQuarrie (resigned); Council on Industrial Health, Drs. Leroy U. Gardner, A. J. Lanza and C. D. Selby; Committee on Scientific Research, Dr. Martin H. Fisher; Committee for the Protection of Medical Research, Dr. William J. Kerr and Father A. M. Schmittalla, and Committee on Postwar Medical Service, Mr. Barry Smith, director of the Commonwealth Fund, to succeed Dr. Alan Gregg (resigned).

Dr. William Weston, Columbia, S. C., and Dr. Edgar P. Copeland, Washington, D. C., were appointed to serve as conference members of the Committee on Cooperation with Government and Medical Agencies of the American Pediatric Society, for the purpose of taking up any child health emergency situations that may arise.

HANDLING OF POSTWAR MEDICAL SUPPLIES

The Secretary and General Manager was authorized to notify the United States Public Health Service that the recommendations of the Committee on Drugs and Medical Supplies of the Division of Medical Sciences of the National Research Council, as reported to the Committee on Postwar Medical Service, are concurred in by the Board and represent its principle in the handling of postwar medical supplies.

MISCELLANEOUS

Many other matters, too numerous to mention in the limited space available for this abstract, were considered by the Board. Some of these will be reported on in the future.

N. B. C. NETWORK BROADCASTS OF DOCTORS LOOK AHEAD

Doctors Look Ahead in the next four weeks to four vital topics affecting the health of the nation in the critical months of war and peace approaching:

March 24. Juvenile Delinquency, a topic which is on every tongue and for which innumerable solutions are proposed. Doctors Look Ahead will stress the responsibility of parents for the so-called delinquency of youth.

March 31. Accidents, which have taken an increased toll of American lives on the highway and in industry but even more so in the home. Doctors Look Ahead will stress prevention of accidents and emergency care of the injured.

April 7. Tuberculosis, which was numbered a few years ago among declining diseases but which has now begun again to show its usual wartime trend, namely upward. Doctors Look Ahead will point out the causes and suggest countermeasures.

April 14. Cancer, to which the nation's attention is officially directed in presenting by proclamation of the President pursuant to act of Congress. Doctors Look Ahead will stress new opportunities for cancer victims of the future.

Doctors Look Ahead is heard on one hundred and twenty-three stations of the National Broadcasting Company network each Saturday at 4 p. m. Eastern War Time, (3 p. m. Central War Time, 2 p. m. Mountain War Time and 1 p. m. Pacific War Time). Some stations may record the program and broadcast it at a time which suits their schedule better. Local newspaper radio announcements should be consulted.

Washington Letter

(From a Special Correspondent)

March 19, 1945.

Military Affairs Committee Studies Nurse Draft

Hearings on the proposed nurse draft opened this morning in the Senate Military Affairs Committee room in the Capitol with Senator Elbert D. Thomas, Democrat of Utah, presiding. The Senate group had decided to hold public hearings on the House approved nurse draft bill following decisions in both chambers on manpower legislation. Conferences also opened today between the House and the Senate to reconcile the conflicting manpower bills passed by each body.

The House bill would draft unmarried nurses, male and female, for commissions in the armed forces, affecting nurses over 19 and under 45. It passed the House March 7. Senator Thomas said that in view of amendments made by the House to the May nurse bill, and changes in regulations made by the Army and Navy, prospects of agreement with the House appeared very favorable. Among changes in army and navy requirements which give the bill more favorable Senate chances are those lifting the Navy's ban against marriages in the Navy Nurse Corps and the lowering of the Army's physical requirements. Senator Thomas said that amendments putting male nurses on the same basis as female nurses and the ban on interference with the education of nurses would also win Senate support.

The National Nursing Council urges an immediate inventory of all nurses up to 65, married and single, as a first step either to drafting or to recruiting voluntary enlistments of nurses. The council, clearing house for the sixteen major nurses' organizations, revealed that although 60 per cent of the more than 220,000 active nurses not on military duty are eligible for Army and Navy service, voluntary response has dwindled to about 800 a week.

Administration Starts Its Own Probe of Veterans' Hospitals

The administration moved quickly to conduct its own investigation of magazine charges that veterans are receiving improper treatment in government hospitals. Representative Rankin, Democrat of Mississippi, announced that the House World War Veterans Committee, of which he is chairman, will investigate, following the announcement by Veterans Administrator Frank T. Hines that he had ordered a sweeping probe into all veteran hospital facilities throughout the country. The charges

had wide repercussions. Newspapers recommended that the Veterans Administration hospitals and doctors be freed "from the blighting hand of lay domination that now grips it." Brigadier General Hines was described as "the last man in the world who should be controlling this program . . . he displays an unconscious antipathy toward good medicine." Replacement of the present medical director of the Veterans Administration hospital program, Dr. Charles M. Griffith, "by an outstanding medical man not lacking in spine, vision and energy," also was urged. It was proposed that such a man should be aided by an advisory group of medical experts and "given freedom to shake up the whole program and to provide the best available medicine for our sick and disabled vets." Mrs. Roosevelt entered the controversy by blaming the people of the nation for "neglecting to know" what is going on in veterans hospitals. "As citizens we should visit the hospitals and pay attention to what we see," she said.

Sparkman Urges Program for Physically Handicapped

The need for a national program of rehabilitation for the physically handicapped was likened by Representative John J. Sparkman of Alabama to the national need for a program of rehabilitating physical resources, forests, soil and water, which brought the Tennessee Valley Authority to his district. Addressing the Washington Lodge of the American Federation of the Physically Handicapped, in the National Press Club lounge, he said "Only ignorance of the situation has caused us to lag so badly in rehabilitation of human beings." Under present rehabilitation laws an average of 8,500 persons a year have been rehabilitated and "made self respecting, productive taxpayers," he said. However, "casualties on the home front have been 800,000 a year." He expressed confidence that the House will continue a study of the problem begun last session by a subcommittee under Representative Augustine B. Kelley of Pennsylvania. Capt. Howard H. Montgomery, Navy officer in charge of rehabilitation, outlined the Navy's program to return disabled men to usefulness, and Earle M. Sawyer, Civil Service Commission consultant, told of placement of handicapped in federal service.

Druggists Advise Caution in Use of Penicillin

Although 130 billion units of penicillin, or about 6,500,000 doses, are being rushed to the nation's drug stores, hospitals and drug supply houses for civilian use starting March 15, purchasers have been warned by druggists to exercise care in its use. "The penicillin we have available is for injection under conditions that virtually call for hospitalization," said a spokesman for the Washington Druggists Association. "It requires injections at three hour intervals over a protracted period and under constant observation. Because of this we believe enough has been made available to meet present requirements." The drug supply section of the War Production Board said that though a physician's prescription is not mandatory for sale of the drug, because of the form in which it has been made available, almost no druggist will sell it except at a doctor's request. The present release must last until April 1, but the WPB has guaranteed a minimum of 1,000,000 additional vials for April, and it expects the amounts to continue to increase.

Congress Honors Chinese Doctor Who Saved Fliers

Dr. Shen-Yen-Chen, Chinese doctor who gave medical care to Lieutenant Ted Lawson and four companions forced down over Free China after a raid on Tokyo, was introduced to Congress by Representative Jennings Randolph. He refused payment from the fliers, but in appreciation the United States is giving him a two year surgery course at Harvard Medical School. The feat is portrayed in the current movie "Thirty Seconds Over Tokyo."

Capital Notes

Ten medical officers of the Veterans Administration will attend an eight week course in tropical diseases conducted by the Army Medical School at Walter Reed Hospital Army Medical Center.

Governor Herbert O'Connor of Maryland announced extensive postwar hospital building plans for the state when he opened a drive to raise \$700,000 for a general hospital in Silver Spring, which adjoins the Capital.

The National Capital Parks and Planning Commission has approved plans for construction of two new hospitals in the District, Georgetown University and George Washington University to be the sponsors. They will each house 400 patients.

Electrical creation of speech was demonstrated to the National Geographic Society in Constitution Hall by Dr. J. Owen Perrine, with a machine, Voder, operated from a console like an old fashioned organ, to talk, recite poetry, converse with an audience, laugh and sing.

War has developed diversified uses for x-ray equipment in both medical and industrial fields, WPB reports, stressing the importance of this equipment in treating battle casualties.

Penicillin in the treatment of infections was discussed by the Smith-Reed Russell Society in George Washington University School of Medicine auditorium, with Dr. Chester F. Keefer, professor of medicine at Boston University, leading the discussions.

At the District of Columbia Medical Society this week Dr. Wilfred Overholser, superintendent of St. Elizabeths Hospital, was to speak on mental hygiene, and the Syphilis Journal Club was to hear talks by Drs. John R. Heller and C. James Van Slyke of the U. S. Public Health Service and Drs. Richard C. Arnold and John F. Mahoney, Staten Island, N. Y.

The Red Cross discloses that it is getting back in the form of a powerful measles preventive some of the blood it gave the armed forces, the preventive being immune serum globulin.

The oldest WAC hospital unit in the Army has received a plaque for its good work at Walter Reed General Hospital from Major Gen. Shelley U. Marietta, U. S. Army, commanding general of the Army Medical Center.

Inability of volunteer workers to lift a dying man into an ambulance has launched an inquiry here which may result in the practice, abandoned because of war shortages, of having physicians ride ambulances on emergency calls.

Disabled job applicants, including blind, deaf, armless and legless men and women, are being assisted into jobs with government or private industry through a new "job clinic" set up here.

Vice Admiral Ross McIntire, Surgeon General of the Navy, in an appeal for the Red Cross, said that the organization "cannot falter, because tougher fighting and higher casualties than bloody Iwo Jima lie ahead."

Medical Legislation

STATE LEGISLATION

Delaware

Bill Introduced.—H. 327 proposes in effect to permit any person licensed to practice the healing art in Delaware to render the medical care called for by the workmen's compensation act.

Illinois

Bill Introduced.—S. 167 proposes to condition the issuance of a license to marry on the presentation of a physician's certificate that he has examined the prospective marital partners to determine whether or not they have conflicting blood types and that the determination of such examination has been communicated to the parties.

Maryland

Bills Introduced.—S. 517, to amend the medical practice act, proposes to authorize the issuance without examination of a license to practice medicine and surgery to resident citizens of Maryland over 30 years of age who have graduated from a class A medical school, have had at least one year of internship in a recognized hospital and have had at least three years of active service as a medical officer in the armed forces, in the Public Health Service or in the Veterans Administration. H. 321 proposes to authorize the state board of health or a local health officer, when it or he has reasonable cause to believe that any person is infected with a venereal disease and is likely to be a source of infection, to cause a medical

examination to be made of the person and, if the person is found to be infected with a venereal disease, to require such person to submit to treatment therefor.

Michigan

Bill Introduced.—H. 257 proposes to authorize the governor to appoint a board of industrial medical examiners to examine and license applicants to practice as industrial medical assistants. Such licentiates, however, are prohibited from practicing medicine or from undertaking the treatment or cure of disease.

Minnesota

Bills Introduced.—H. 632 proposes to require all hospitals supported in whole or in part by public funds and which are equipped with appropriate x-ray units, when requested by a licensed practitioner of any form of the healing art, to make x-ray examinations of the human chest for the purpose of diagnosing pulmonary tuberculosis. H. 786 proposes to create a sickness benefit fund from contributions by employees for the payment of benefits to employees who are sick and unable to work.

Missouri

Bill Introduced.—H. 206 proposes to prohibit any licensed physician, dentist, optometrist, osteopath, chiropractor, chiropract or veterinarian from utilizing the prefix "Doctor" or "Dr." in connection with his name in a professional use without affixing thereto suitable words or letters designating the degree possessed or the particular type of practice in which he is engaged.

Nevada

Bills Introduced.—S. 125 proposes to require a public hospital to admit venereal disease cases at the expense of the county involved when, in the opinion of the state department of health, the appropriate local health officer or the director of venereal disease control, the persons infected with venereal disease may be a menace to public health. A. 156, to amend the laws relating to the practice of osteopathy, proposes, among other things, to eliminate those provisions limiting the scope of the practice permitted to osteopaths to manipulation and denying osteopaths the right to practice obstetrics, to administer or prescribe drugs or to perform surgical operations. Possibly the intended effect of this bill is to permit osteopaths to practice medicine and surgery without restriction. A. 165 proposes to authorize the establishment and operation of the Nevada Tuberculosis Sanatorium. A. 172 proposes to authorize the payment of cash sickness insurance to persons unable to work because of sickness. A. 175 proposes to enact a venereal disease control act. Among other things, the bill proposes to require any person who makes a diagnosis or treats a case of venereal disease and the superintendent of a hospital or dispensary or other institution in which there is a case of venereal disease to report the facts immediately to the county health officer. The bill proposes to provide for compulsory detention and treatment under stated conditions. Any person other than a licensed physician who undertakes to treat or prescribe for a venereal disease, or any druggist who refills a prescription without the instructions of the prescribing physician, is to be guilty of a misdemeanor and subject to fine. All residents of the state between 14 and 65 are to be required to "have their blood examined for syphilis by an approved laboratory test" and any person failing to do so is to be guilty of a misdemeanor.

New Mexico

Bill Introduced.—H. 275 proposes what in effect is a system of compulsory health insurance.

North Carolina

Bills Introduced.—S. 293 and H. 594 propose to provide a statewide program of hospital and medical care and to create the North Carolina Medical Care Commission, which is to be authorized on behalf of the state to contribute one dollar a day for each indigent patient hospitalized in any approved hospital and to survey the state to determine the hospital needs of the state and to make loans to medical students. The University of North Carolina is to be authorized to expand its two year

medical school into a standard four year medical school and to construct and equip a hospital at the university of at least 400 beds to provide hospital facilities for the people of the state. H. 554 proposes to establish a state cancer commission to establish and operate cancer clinics in the state. H. 786 proposes to require the state board of health to administer a program for the prevention and cure of cancer. With respect to indigent cancer patients, the board is to provide financial aid for diagnosis and treatment in any approved hospital in the state.

Ohio

Bills Introduced.—H. 284 proposes to enact a separate chiropractic practice act and to create an independent board of chiropractic examiners to examine and license applicants for licenses to practice chiropractic. H. 224, to supplement the medical practice act, proposes in effect to require the board of medical examiners to issue without examination a license to practice naturopathy to any resident who at the time of the passage of this bill is licensed to practice naturopathy in any other state. The bill further proposes to require the board to examine any person who holds a degree of Doctor of Naturopathy and who applies for a license.

Oklahoma

Bill Introduced.—H. 367 proposes to require every physician attending a pregnant woman to take or cause to be taken a sample of her blood at the time of the first examination and to submit that sample to an approved laboratory for a standard serologic test for syphilis.

Pennsylvania

Bills Introduced.—S. 398 proposes to appropriate \$2,000,000 to the Department of Health to establish rheumatic fever clinics throughout the state. S. 355 proposes to authorize the State Department of Health to require all persons reasonably suspected of being infected with venereal disease to submit to medical examination and blood test or other approved diagnostic procedure for the purpose of ascertaining the presence of venereal disease. The board is to be given power to require such person to submit to the diagnostic procedures indicated and if found infected to submit to appropriate treatment. The bill further proposes to condition the issuance of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate that the party has submitted to an examination and serologic test to determine the existence or nonexistence of syphilis and that in the physician's opinion the party is not infected with that disease or if so infected is not in a stage of the disease which is likely to become communicable. Likewise the bill proposes to require every physician attending a pregnant woman to take or cause to be taken, unless the woman dissents, a sample of her blood and to submit such sample to an approved laboratory for an approved serologic test for syphilis. H. 667 proposes that all residents under 12 years or residents over 65 be given a complete medical examination by examiners appointed by the secretary of health medical examiners. If the need for medical care is indicated from such examinations and if care cannot be provided because of financial conditions it is to be the duty of the state to provide necessary care. H. 880 proposes to authorize an incorporated nonprofit hospital to condemn such land as it desires for any purpose consonant with its charter or articles of incorporation.

Rhode Island

Bill Introduced.—H. 733 proposes to enact a naturopathic practice act.

South Carolina

Bill Introduced.—S. 60 proposes to condition the issuance of a license to marry on the presentation by each party to the proposed marriage of a physician's certificate, based on physical examination and on approved laboratory procedures, that the party either is not infected with syphilis or if so infected is not in a stage of that disease which may become communicable to the marital partner.

Texas

Bills Introduced.—H. J. Res. 59 proposes to submit to the electors of the state a proposition that in effect would do away with the present constitutional provision in Texas prohibiting the legislature from showing any discrimination between schools of medicine. The net effect of the proposed constitutional amendment would be to permit the legislature to enact separate cult practice acts with lower educational requirements than those now present in the medical practice act. H. 720 proposes so to amend the medical practice act as to make its provisions inapplicable "to chiropractors, duly licensed under the laws of this state, who confine their practice strictly to chiropractic as defined by statute."

Vermont

Bills Introduced.—H. 225 proposes so to amend the narcotic drug act as to expand the term "narcotic drugs" specifically to include isonipecaine. H. 222 proposes to authorize the State Department of Health to accept funds made available by federal law to the several states for assistance in the promotion of health and prevention of disease. S. 52 proposes to provide for a Vermont blood plasma bank to be governed by a board of control appointed by the governor. One member of the board is to be from the State Board of Health, one from the faculty of the medical college of the state university, one from the Vermont Hospital Association, one from the state medical society and one from the State Department of the American Legion.

Wisconsin

Bill Introduced.—A. 372, to amend the medical practice act, proposes to authorize the suspension, as well as the revocation, of a license to practice medicine for the causes stated in the present law.

Council on Medical Service and Public Relations

INSURANCE PLAN LEGISLATION

The Council has been informed by the Bureau of Legal Medicine and Legislation on the basis of advice from its legislative reporting service that so far in 1945 laws authorizing organization and operation of nonprofit medical service plan corporations have been enacted in Tennessee, Iowa and North Dakota. Similar bills are in process of enactment in Kansas, Minnesota and South Dakota. In addition, a law permitting a nonprofit hospital service corporation to operate a supplementary medical service plan in conjunction with a hospital service plan has been enacted in West Virginia. No other similar bills are pending today, according to available information.

IOWA PASSES MEDICAL SERVICE PLAN LEGISLATION

A bill to authorize the operation of nonprofit service plans in Iowa was approved by the governor on February 15. It is understood that the Iowa Medical Service, sponsored by the Iowa State Medical Society, has qualified under the law and expects to offer to the public a medical plan which in some aspects is broader than any plan now operating under medical society auspices. Subscribers to the proposed plan of Iowa Medical Service will be insured against the costs of surgical and obstetric services in or out of the hospital and medical care for hospitalized illnesses after the first three day period in the hospital. X-ray examinations will be covered not to exceed \$15 for each service and with \$10 allowed for anesthesia. The basic cost is to be \$1 for individuals and \$3.25 for the family contract. Mr. Edwin M. Kingery, the executive secretary of the Polk County Medical Society, is to act as executive director of the Iowa Medical Service plan and is to serve half time with the Polk County Society and half time with Iowa Medical Service.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST: SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Professorship in Obstetrics Named for Lyle McNeile.—A chair in obstetrics has been created at the University of Southern California School of Medicine, Los Angeles, in honor of the late Dr. Lyle G. McNeile, who organized the department of obstetrics and gynecology. He was a member of the first faculty of the school of medicine when it became affiliated with the University of Southern California in 1909. In 1931 he organized the department of obstetrics and gynecology, serving as instructor until 1939. He was emeritus professor at the time of his death in Los Angeles March 1.

CONNECTICUT

Alcohol Study.—The section of alcohol studies of the Laboratory of Applied Physiology, Yale University, plans to hold its third annual session July 10-August 3. The summer session was established in 1943 as the first formal school of its kind in the nation to make the results of scientific research available for application to the problems of alcohol in the community (THE JOURNAL, June 12, 1943 p. 454). This year's program will include daily seminars and lectures, and enrollment will be limited to 150 students. Application for admission to the session must be made by April 1.

Conference Talks at Institute of Living.—On February 7 the Institute of Living opened a ten week series of conference talks on neurology, psychiatry and allied sciences. Dr. Harry C. Solomon, clinical professor of psychiatry, Harvard Medical School, Boston, gave the first lecture, on psychiatry. Those who have given lectures and those who will speak include:

- Dr. Nolan D. C. Lewis, New York, Shock Therapy—Evidence For and Against Damage, February 14.
- Dr. Abraham Myerson, Boston, Constitution and Heredity, February 21.
- Dr. Sander Lorand, New York, Hypnotism as a Method of Therapy, February 28.
- Robert H. Felix, assistant surgeon general, U. S. Public Health Service, U. S. Public Health Service Attacks Mental Illness, March 7.
- Dr. Hiram Houston, New York, Curability of Epilepsy, March 14.
- Dr. Franz G. Alexander, Chicago, Practical and Flexible Psychoanalytic Techniques, March 21.
- Dr. Winfred Overholser, Washington, D. C., Psychiatry and the Law, March 28.
- Francis O. Schmitt, Ph.D., Cambridge, Mass., Physics and Technology in the Development of Physical Medicine, April 4.
- Carney Landis, Ph.D., New York, New Developments in Psychologic Tests, April 11.

ILLINOIS

Personal.—Dr. Roland R. Cross, Springfield, director of the Illinois Department of Public Health, has been named by Governor Green as chairman of an advisory committee on medical services to serve with the governor's committee on veterans' rehabilitation and employment.

Chicago

Personal.—Dr. Andrew C. Ivy, professor of physiology at Northwestern University Medical School, has been named to a three year term of membership to the National Advisory Cancer Council of the U. S. Public Health Service.

Robert Brown Named Medical Director at St. Luke's.—Dr. Robert F. Brown, assistant superintendent of the Stanford University Hospitals, San Francisco, has been appointed assistant administrator and medical director of St. Luke's Hospital, effective March 15. Dr. Brown graduated at the University of Oregon Medical School, Portland, in 1938, becoming assistant to the superintendent of Stanford University Hospitals in July 1942 and assistant superintendent in December 1943. Dr. Ambrose P. Merrill resigned as medical director January 1 (THE JOURNAL, January 6, p. 45).

Dr. Wakerlin New Chairman of Cancer Committee.—Dr. George E. Wakerlin, professor of physiology and head of the department, University of Illinois College of Medicine, has been elected chairman of the Chicago Cancer Committee, succeeding Dr. Ludvig Hektoen, who becomes honorary chairman. The committee will maintain offices at 139 North Clark Street, which will be shared by the Field Army of the American Cancer Society, of which Mrs. Arthur I. Edison is Illinois Commander, and where a central cancer information and referral center will be established.

Derrick Vail Named Professor of Ophthalmology at Northwestern.—Dr. Derrick T. Vail Jr., colonel in the Army medical corps and chief consultant to the Surgeon General in ophthalmology, has been appointed professor of ophthalmology and chairman of the department at Northwestern University Medical School. He will succeed the late Dr. Sanford R. Gifford, who was professor of ophthalmology at the medical school from 1929 until his death in February 1944. Dr. Vail graduated at Harvard Medical School, Boston, in 1923. Since 1926 he has been associated with the University of Cincinnati College of Medicine, first as instructor in ophthalmology and since 1937 as professor. Dr. Vail was Secretary of the Section on Ophthalmology of the American Medical Association from 1937 to 1942. He will take up his appointment at Northwestern as soon as he is released from the Army.

INDIANA

Executive Assistant for State Health Officer.—Mr. Walter J. Wolpert, formerly state director of training for the Federal Works Agency, has been appointed executive assistant to Dr. Thurman B. Rice, Indianapolis, acting secretary of the Indiana State Board of Health and acting state health commissioner. Mr. Wolpert will be essentially a business manager of the board of health and will be in charge of personnel and property, such as the building, equipment and automobiles. He will assist the commissioner in all sorts of matters which are nonprofessional.

KANSAS

Personal.—Dr. John L. Latimore, Topeka, has resigned from the state board of health because he is now serving in the state house of representatives. Dr. Gilbert A. Leslie, McDonald, resigned because he was moving to Golden, Colo. —Dr. and Mrs. Eben S. McIntosh, Burns, recently celebrated their golden wedding anniversary.

School Health Survey.—The Kansas State Board of Health is sponsoring a statewide school health study in cooperation with the state department of public instruction and other state agencies interested in child health, education and welfare. Ground work was laid at a series of committee meetings the week end of February 10, at which Clair E. Turner, Dr. P. H., temporarily on leave from the Office of the Coordinator of Inter-American Affairs, Washington, D. C., as health education officer, was in attendance.

MASSACHUSETTS

State Meeting Canceled.—The annual meeting of the Massachusetts Medical Society, scheduled for May 22-24 at the Hotel Statler, Boston, has been canceled.

Tufts Alumni Association's Annual Dinner.—On April 11 the Tufts Medical Alumni Association of Greater Boston will hold its annual dinner meeting at the Copley Plaza, Boston. Among the speakers will be Senator Claude D. Pepper, who will discuss the findings and recommendations of the senate subcommittee on wartime health and education, of which he is chairman, and Drs. Alonzo K. Paine, professor of obstetrics; Dr. Louis E. Phaneuf, professor of gynecology; Capt. Albert Warren Stearns, dean on leave; Dr. Dwight O'Hara, acting dean; Dr. Benedict F. Boland, clinical professor of gynecology, and Leonard Carmichael, LL.D., president of Tufts College.

MICHIGAN

Site Changed in Medical Center Program.—At a recent meeting of the board of education a resolution was approved recommending that the corporation counsel be requested to withdraw from the condemnation proceedings now in progress to acquire possession of the block bounded by Hastings, St. Antoine, Farnsworth and Theodore avenues (THE JOURNAL, Dec. 2, 1944, p. 905) and substitute the block bounded by Beaubien, St. Antoine, Theodore and Warren avenues. Under other condemnation proceedings now under way this would make available for the center the three block area bounded by Beaubien, St. Antoine, Frederick and Warren. Dr. Basil C. MacLean, medical director of the Strong Memorial Hospital, University of Rochester, has been employed by the Medical Science Center of Wayne University to help in analyzing the construction, operating and program figures of the center. Dr. MacLean is making a detailed study of the units involved in the first cycle. Detroit Medical News reports that, pending the completion of Dr. MacLean's work, the fund raising counsel has been temporarily discontinued.

State Society Launches New Radio Program.—The Michigan State Medical Society has inaugurated a series of radio broadcasts including music, songs and stories over Station WJR at a cost of more than \$10,000 and under the

supervision of the society's special committee on radio. Dr. Clarence L. Candler, Detroit, chairman of the committee, gave the inaugural lecture February 16. Among the speakers participating in the series, which will run Friday evenings for fifteen minutes beginning at 7:15, Eastern War Time, are:

Dr. L. Fernald Foster, Bay City, Purposes of the Michigan State Medical Society, February 23.
Dr. William A. Hyland, Grand Rapids, Michigan Medical Service, March 2.
Dr. Oscar D. Stryker, Fremont, Medical Men in Service, March 9.
Dr. Wilfrid Haughey, Battle Creek, Psychiatry After the War, March 16.
Dr. Edward F. Sladek, Traverse City, Voluntary Programs of Medical Care, March 23.
Dr. Ray S. Morrish, Flint, Health Education of the Public, March 30.
Dr. Otto O. Beck, Birmingham, Protection Against Major Hazards of Illness, April 6.

A feature of the program is the opportunity to win a \$25 war bond or \$5 in war stamps each week. The contest includes the reporting of an interesting experience involving a doctor of medicine. In addition to Dr. Candler, other members of the committee on radio are Drs. Andrew S. Brunk, Detroit, president of the state society, and Patrick L. Ledwidge, Detroit. Another radio series sponsored by the state society featured dramatized skits.

MINNESOTA

The Judd Lectureship.—Dr. Allen O. Whipple, professor of surgery, Columbia University College of Physicians and Surgeons, New York, will present the annual E. Starr Judd lectureship in surgery at the University of Minnesota Medical School, Minneapolis, April 10, in the Museum of Natural History Auditorium. The title of his lecture will be "Problem of Portal Hypertension in Relation to Hepatosplenopathies."

Academy of Medicine Observes Twenty-Fifth Anniversary.—The Minneapolis Academy of Medicine celebrated its twenty-fifth anniversary with a dinner meeting at which Capt. Donald McCarthy (MC), chief of medicine, U. S. Naval Station Hospital, Great Lakes, Ill., discussed "Penicillin Therapy of Meningococcic Meningitis." Officers of the academy are Drs. Ernest R. Anderson, president; Jay C. Davis, vice president; Cyrus O. Hansen, secretary, and Thomas J. Kinsella, treasurer, all of Minneapolis.

Proposed Heart Hospital for Children.—The conversion of the Motley School in Minneapolis, now closed, into a heart hospital for children, has been proposed. Dr. Charles R. Drake, Minneapolis, is one of a committee of five appointed to take action on the project. Fifty thousand dollars has been offered for the building by the Variety Club, an organization of men in the entertainment field, with the intention of deeding it to the University of Minnesota and the stipulation that it be used as a heart hospital for children.

Chiropractor Returned to Workhouse.—An order signed by Judge Levi M. Hall of the Hennepin County District Court recently returned Michael J. Koehler, Minneapolis, to the Minneapolis workhouse to serve ten and one-half months remaining of a sentence imposed July 6, 1944 (*THE JOURNAL*, Aug. 19, 1944, p. 1150) for criminal abortion. Koehler had been released from the workhouse Oct. 20, 1944, after serving only forty-two days of his one year sentence on his lawyer's claim that Koehler was suffering from diabetes and chronic bronchitis and had to be under the care of his private physician. Koehler, whose chiropractic license had been revoked Sept. 6, 1944 following his plea of guilty to the performance of an illegal operation, was discovered by the women's bureau of the Minneapolis Police Department to be examining a woman patient at his old office seventeen days after being released from the workhouse and offering to do another criminal abortion for \$200.

MISSISSIPPI

Postgraduate Lectures.—The Mississippi State Board of Health and the Tulane University of Louisiana School of Medicine, New Orleans, are cooperating in a series of postgraduate lectures to be given throughout the state the last week in March. Newspapers report that the series will be held in Jackson March 26, Hattiesburg March 27, Meridian March 28, Tupelo March 29 and Greenwood March 30. Among the instructors will be Drs. Ralph V. Platou, head of the department of pediatrics at Tulane, George A. Mayer of the department of obstetrics and Virginia F. S. Howard of the division of maternal and child health of the Mississippi State Board of Health.

NEBRASKA

State Meeting Canceled.—The Nebraska State Medical Association announces that its seventy-seventh annual assembly has been canceled. The meeting was scheduled for Lincoln, May 7-10.

NEW YORK

New York's Health.—The death rate from all causes for New York in 1944 was 11 per thousand of population, 7 per cent less than in 1943. Lower rates were recorded only twice in the past, 10.8 in 1941 and 10.9 in 1942. The epidemic of poliomyelitis in 1944 caused the death of 337 persons more than in any previous year except in 1916 and 1931. The number of births declined to 230,000, giving a rate of 16.6 per cent, 9 per cent less than in 1943. The infant mortality was 33 deaths under 1 year per thousand live births. Maternal mortality was 17 deaths per 10,000 live and still births, 14 per cent below the previous minimum of 1943 and one third the rate of 1934, the year beginning the decline in maternal mortality in the state. Death from tuberculosis gave a rate of 44.6, an all time low record. A new low rate was established for suicides, 10.3. The rate for homicides was 2.1. Deaths from motor vehicle accidents declined from 10 per cent to 11.4, the lowest since 1917.

New York City

Committee on Glaucoma.—Dr. Willis S. Knighton has been named chairman of the committee on glaucoma of the National Society for the Prevention of Blindness, succeeding the late Dr. Mark J. Schoenberg. Recent additions to the committee on glaucoma include Major Fred W. Heffinger, superintendent, and Dr. Ferdinand L. P. Koch, chief of the glaucoma clinic, Manhattan Eye, Ear and Throat Hospital.

The Doctors' Orchestra Resumes Rehearsals.—The Doctors' Orchestral Society announces that rehearsals have been resumed and now take place on the first and third Thursdays of each month at the National Hospital for Speech Disorders, 61 Irving Place, according to *New York Medicine*. The orchestra is functioning as a string symphony conducted by Mr. Fritz Mahler. Recently elected officers of the society are Dr. William H. Spielberg, president and concert master; Charles S. Gardner, D.D.S., vice president; Dr. Harold S. Belcher, secretary and Dr. Charles Auer, treasurer.

Society News.—Dr. Jacob M. Gerslberg was recently elected president of the International Spanish Speaking Association of Physicians. Other officers include Drs. Ray Lyman Wilbur, San Francisco; James R. Goodall, Montreal, Que., and Juan B. Sacasa, Los Angeles, vice presidents. Dr. George W. Henry is chairman of the board of directors. Vincent du Vigneaud, Ph.D., professor of biochemistry, Cornell University Medical College, gave the principal paper, on "Recent Concepts of Metabolism of Choline and Methionine," before the Clinical Society of the New York Diabetes Association, February 8, at the New York Academy of Medicine. Recently elected officers of the New York Society of Physical Medicine include Drs. Karl Harpuder, president; Charles G. Buckmaster, vice president; Richard Kovacs, treasurer, and Madge C. L. McGuinness, secretary.

Symposium on Industrial Medicine.—The New York Post-Graduate Medical School and Hospital, Columbia University, announces an interdepartmental symposium on industrial medicine April 2-6 under the direction of Drs. Harry J. Johnson and Frank R. Ferlaino. In addition to members of the teaching staff of the medical school, the following guest speakers will participate:

Dr. Leverett D. Bristol, chairman, committee on education, Council on Industrial Health, American Medical Association.
Dr. C. Charles Burlingame, associate in psychiatry, Columbia University College of Physicians and Surgeons, and chairman, committee on industrial medicine, American Society for Research in Psychosomatic Problems.

Miss Patricia Edgerly, director, New York Medical Exchange.
Frederick B. Flinn, Ph.D., professor of industrial hygiene, DeLamar Institute of Public Health, Columbia University.
Dr. Forrest D. Gibson, Hartford, Conn., Hamilton Standard Propeller Division, United Aircraft Corporation.
Dr. Eugene J. Gillespie, Washington, D. C., tuberculosis control division, U. S. Public Health Service.
Dr. Edward C. Greene, medical director, American Air Lines.
Dr. Joseph P. Hoguet, medical director, Republic Aviation Corporation.
Dr. John F. Johnson, medical director, Eastern Aircraft Division, General Motors Corporation.
Dr. Anthony J. Lanza, assistant medical director, Metropolitan Life Insurance Company.
Dr. Raphael Lewy, chief medical examiner, New York State Department of Labor, Compensation Bureau, New York.
Dr. Richard M. Mills, Brooklyn, medical director, New York Telephone Company.
Dr. Dwight O'Hara, Boston, acting director, division of industrial medicine, Liberty Mutual Insurance Company.
Dr. Charles R. Williams, supervisor, industrial hygiene field service, Liberty Mutual Insurance Company.

John Scudder Goes to China to Organize Plasma Service.—Dr. John Scudder, director of the blood bank at the Presbyterian Hospital, arrived in Kunming, China, March 13, to organize the plasma service for the Chinese armies. In this work he will serve as a special consultant to Hsu Hsien.

surgeon general of the Chinese Army Administration. Dr. Scudder is on leave of absence from his position at the Columbia University-Presbyterian Hospital Medical Center. Dr. Scudder went to China by airplane. The first Chinese blood bank, trained by Dr. Scudder at Presbyterian Hospital (THE JOURNAL, Aug. 14, 1943, p. 1137), has been functioning in Kunning since July 12, 1944 and has been supplying plasma to Chinese troops in Yunnan. The bank was organized in New York and was the first in the world entirely manned by Chinese doctors, nurses and technicians to prepare plasma for the armies of China. After a trial run in New York it was transferred to China. Dr. Scudder will assist the bank to overcome technical difficulties and to increase its output.

NORTH CAROLINA

State Medical Meeting Postponed.—For the first time since the Civil War the annual meeting of the Medical Society of the State of North Carolina has been postponed. It was scheduled to be held at Pinchurst, April 30-May 2. The action was voted on unanimously by the executive committee and all officers and committees are continued in office until such time as will seem practical to hold the next meeting. The postponement will continue until the ban for conventions is lifted.

University News.—Dr. Harold D. Green, formerly associate professor of physiology at Western Reserve University School of Medicine, Cleveland, has assumed the position of professor of physiology and pharmacology at Bowman Gray School of Medicine of Wake Forest College, Winston-Salem. Robert W. Lackey, Ph.D., professor of physiology at Southwestern Medical Foundation School of Medicine, Dallas, will serve as visiting professor of physiology for the trimester beginning March 28. The extensive lantern slide collection of the late Dr. Charles Hartwell Cocke, Asheville, has been presented to the Bowman Gray School of Medicine and added to the teaching collection of the school. Bids for the new \$250,000 outpatient department building were to be opened on March 20. Construction will begin immediately.

OHIO

New Assistant Commissioner of Mental Diseases.—Dr. Attilio LaGuardia, assistant director of Rockland State Hospital, Orangeburg, N. Y., has been appointed assistant commissioner of mental diseases for Ohio, according to the *New York Times*, February 18.

New Fund for Cancer Research.—The Ohio State University College of Medicine, Columbus, will receive \$20,000 from the estate of the late Werner Strang, Columbus builder, for the establishment of the "Werner Strang and Asta K. Strang Foundation for Cancer Research."

Gifts to Cincinnati College of Medicine.—Recent gifts to the University of Cincinnati College of Medicine include \$10,000 to the Christian R. Holmes Hospital from the Holmes Foundation, Inc., \$7,500 over three years from the Nutrition Foundation, Inc., for research directed by Dr. Josef Warkany, assistant professor of pediatrics, \$17,250 from six contributors for research directed by Dr. Tom D. Spies, associate professor of medicine, and \$5,000 from Mrs. David May to the college of medicine May Fund.

Industrial Commission Refuses Payments in Cleveland Disaster.—The State Industrial Commission has refused to make payments from its catastrophe fund to dependents of East Ohio Gas Company employees killed in the Oct. 20, 1944 Cleveland fire and directed the utility, a self insurer, to settle the claims. Seventy-three East Ohio workers were killed. The company contended that it comes under regulations of the commission for disaster payments from state funds providing a maximum of \$7,000 plus \$200 burial expenses for each victim, according to the state medical journal.

OKLAHOMA

Changes in Medical Faculty.—Dr. Basil A. Hayes was recently promoted to professor and chairman of the department of urology at the University of Oklahoma School of Medicine, Oklahoma City, and Dr. Ernst Lachmann to professor and chairman of the department of anatomy.

Memorial to Ned Smith.—The library of Dr. Ned R. Smith, president of the county society in 1934, has been presented to the library of the Tulsa County Medical Society by his wife, Mrs. Pluma Delore Smith, as a memorial to her husband. The collection contains not only first editions of the classics and translations from the French and German but also the latest textbooks in the field of neurology and psychiatry. Dr. Smith died in 1944.

OREGON

Officers of State Board.—Dr. Thomas D. Robertson, The Dalles, was recently elected president of the Oregon State Board of Health. Other officers include Drs. DeWitt C. Burkes, Portland, and Lorenzo D. Inskeep, Medford, vice presidents. *Northwest Medicine* reports that Dr. Frederick J. Stricker, who has resigned as state health officer, will continue as secretary of the state board until such time as Dr. Harold M. Erickson, the new state health officer, assumes the activities of the secretary's office (THE JOURNAL, March 3, p. 535).

PENNSYLVANIA

Ninety-One Years of Age.—Dr. George E. Benninghoff, Bradford, observed his ninety-first birthday February 10. He graduated at the University of Wooster Medical Department, Cleveland, in 1879. Dr. Benninghoff first started practice in Kendall Creek but settled in Bradford in 1886. The Bradford Star stated that Dr. Benninghoff retired in 1932 after he had incurred a broken hip in a fall.

Society News.—On April 5 Dr. John W. G. Hannon, Washington, will discuss "Silicosis" before the Fayette County Medical Society.—Dr. William Bates, Philadelphia, will address the Lawrence County Medical Society in New Castle, April 5, on activities of the state medical society since the 1944 annual session. Capt. Charles H. Whalen, M. C., addressed the society recently concerning his experiences in an evacuation hospital in France.

Philadelphia

Changes in Health Bulletin.—During 1945 the *Philadelphia Health Bulletin*, published by the Philadelphia Department of Public Health, will be issued monthly instead of bimonthly and as near the first of the month as possible.

Hospital News.—Kensington Hospital for Women terminated its activities on February 1 as the result of lack of funds and a shortage of nurses and transferred its functions to the Episcopal Hospital. The closed hospital was founded in 1883 by the late Dr. Howard A. Kelly.

Pittsburgh

New Allergy Group.—The Pittsburgh Allergy Society was recently organized with Drs. Leo H. Crip as president and Dr. James A. Mansmann, secretary-treasurer.

Society Moves Offices.—The Allegheny County Medical Society has moved its offices to 225 Jenkins Building. The offices were formerly located at 5092 Jenkins Arcade Building.

SOUTH CAROLINA

Building Fund Started for Permanent Home.—Since Dr. Hugh E. Wyman recently started a building fund for the permanent home of the Columbia Medical Society of Richland County with a gift of a \$500 bond, the fund has grown to \$4,000 through similar contributions.

Hospital Superintendent Becomes Director of Research.—Dr. Charles F. Williams, medical superintendent of the South Carolina State Hospital, Columbia, for thirty years, has resigned to become director of the hospital's research activities, effective May 1, according to the *Sumter Daily Item*. His successor as superintendent will be Dr. Coyt Ham. The report indicated that Dr. Williams would work toward building up the hospital's research foundation, established by the late Mrs. W. S. Brown, Columbia.

Urge Psychology School as Medical Adjunct.—A full time school of psychology to be connected with the Medical College of the State of South Carolina, Charleston, and a system of traveling psychiatric clinics was recommended for South Carolina by Dr. Victor H. Vogel of the U. S. Public Health Service, consultant in Office of Vocational Rehabilitation. The recommendation resulted from a discussion of the ex-
amined which
resulted from the recent amendment of the Vocational Rehabilitation Act.

TEXAS

Conference on Venereal Diseases.—A one day conference on the control of venereal diseases was held in San Antonio, March 5, attended by about 300 representatives of civilian and military agencies. The conference, second of three regional meetings aimed at action to reduce the rate of venereal disease in the nation, followed one at Oklahoma City, March 2-3. The third session was held in Columbia, S. C., March 8-9. Actions taken at the conference include the adoption of a resolution backing two house bills pending in the Texas legislature, one requiring blood tests for syphilis for both parties applying for a marriage license, the other requiring attending physicians to take blood tests for syphilis of pregnant women. Legislation for a state supported institution for delinquent

juvenile Negro girls was among the resolutions made, as was a move for legislation permitting the courts to commit promiscuous sex offenders to institutions for undetermined periods for rehabilitation. It was also suggested that a state school to train social workers be set up in Texas and that a child welfare unit be maintained in each county.

VIRGINIA

Survey to Determine Communities Needing Physicians.—The Medical Society of Virginia, through its department of clinical and medical education, has started a survey to find out the communities in the state which need physicians. A report form has been prepared to assist communities in making known their needs. The *Roanoke Times*, February 26, reported that the medical society is not assuming responsibility for the placing of the physicians but is functioning solely to collect and distribute information with regard to community needs.

University News.—Dr. Stephen H. Watts, former professor of surgery, University of Virginia Department of Medicine, Charlottesville, has added a gift of \$5,000 to an earlier gift of \$15,000 for a Book Fund for the medical library. A gift of \$500 has been received from Dr. Francis H. McGovern, Danville, for the purchase of books in the fields of ophthalmology and otolaryngology for the medical library. The board of directors of the Virginia Society for Crippled Children and Physically Handicapped Adults has given a grant of \$2,500 to Dr. Hugh Page Newhill, assistant professor of neurology and psychiatry at the university, to support his work in the convulsive disorder clinic at the University of Virginia Hospital.

The McGuire Lectures.—The sixteenth annual Stuart McGuire Lectures and the spring postgraduate clinic of the Medical College of Virginia, Richmond, have been combined this year. Dr. Reginald H. Smithwick, Boston, will give the Stuart McGuire lectures April 5 and 6 on "Surgery of the Autonomic Nervous System in Peripheral Vascular Disorders and for the Relief of Visceral Pain" and "Surgical Intervention on the Autonomic Nervous System in Hypertensive Cardiovascular Disease." On April 6 a symposium on hypertension will be conducted by the following:

Dr. Irvine H. Page, Cleveland, Physiologic, Medical and Surgical Aspects of Hypertension.
Drs. Harvey B. Haag and William B. Porter, Richmond, Medical Aspects of Hypertension.
Dr. Benjamin B. Porter, Physiologic Aspects of Hypertension.
Dr. Tiffany J. Porter, Hypertension in Pregnancy.

WEST VIRGINIA

Personal.—Dr. Thomas L. Harris, Parkersburg, president of the West Virginia State Medical Association, has been named by Governor Clarence W. Meadows to a four year term as a member of the board of governors of West Virginia University, Morgantown, effective March 12.

Changes in Hospital Superintendents.—Dr. George E. Gwinn, Beckley, has been named by Governor Clarence W. Meadows as superintendent of Pinecrest Sanitarium to succeed Dr. Erland H. Hedrick, who resigned (*THE JOURNAL*, Dec. 30, 1944, p. 1160) after being elected a member of Congress from the sixth congressional district. Dr. Gwinn has been serving as acting superintendent since January 1. Previous to that date he had served for several years as medical director at the sanitarium.

Compulsory Test for Syphilis.—After June 5 every pregnant woman residing in West Virginia must undergo a standard serologic test for syphilis. The West Virginia legislature, seeking a means to prevent the birth annually in this state of hundreds of children with syphilis, enacted into law a bill (H. B. 9) making it mandatory on every physician engaged to attend a pregnant woman to acquaint her with the provisions of the new law requiring that a standard laboratory test for syphilis be made at the state hygienic laboratory or at other laboratories approved by the state health department. The laboratory will provide a report in triplicate showing the results of the test. Forms will be prepared and furnished by the state health department. The original of the report will be sent to the physician submitting the specimen, a duplicate will be forwarded to the bureau of venereal diseases during the week the test is performed, and the triplicate will be retained by the laboratory for its files. The law provides that all laboratory reports shall be confidential and shall not be open to public inspection. Every physician required to report births and stillbirths shall state on each certificate whether a blood test was performed during pregnancy on a specimen of blood taken from the woman who bore the child. If the test was made, the physician will report the name of

the test used, the date performed and the name of the laboratory making the test. If no test was made, the physician must state the reason therefor. The result of the test must not in any case be reported on the birth certificate. As passed by the legislature, the law provides that the serologic tests are to be made by the state hygienic laboratory without charge. It is further provided that, on request, specimens are to be obtained without charge from pregnant women by county and district health officers. In areas where the services of a district or county health officer are not available the state health department is to assume the responsibility of obtaining the required blood specimens. There is to be no charge for this service.

WISCONSIN

Proposed Division of State Into Districts.—The state board of health will ask the 1945 legislature for the authority to divide the state into twenty sanitary districts instead of nine, which were set up in 1936, and for appropriations to staff and maintain these districts as fast as personnel can be acquired, according to the state medical journal. Although the proposed legislation will seek twenty districts, the board has plans for only seventeen in the near future.

College of Surgeons Holds Chapter Meeting.—The Wisconsin Chapter of the International College of Surgeons will offer the following program at the University Club of Milwaukee, March 28, the speakers to discuss the use of penicillin in the specialties indicated:

Dr. Samuel G. Higgins, Milwaukee, ophthalmology.
Dr. Matthew N. Federspiel, Milwaukee, oral surgery.
Dr. Lemuel D. Smith, Milwaukee, orthopedic surgery.
Dr. Rudolph W. Roethke, Milwaukee, obstetric surgery.
Dr. Walter M. Kearns, Milwaukee, urology.
Dr. Victor F. Marshall, Appleton, abdominal surgery.

GENERAL

Examination of Medical Technologists.—The Registry of Medical Technologists of the American Society of Clinical Pathologists announces that the spring examination of candidates for registration will be held in various parts of the United States and Canada on May 18.

Journal of Investigative Dermatology Resumes Publication.—The Society for Investigative Dermatology announces the resumption of publication of their periodical, the *Journal of Investigative Dermatology*, which temporarily suspended publication in 1942 on account of war conditions. The first number of volume 6 appeared in February. It will be issued bimonthly, one volume a year, at \$6 per volume, by the Williams and Wilkins Company, Baltimore 2.

Manuscripts Invited in Norton Medical Award.—December 1 has been announced as the final date for submission of manuscripts in the Norton Medical Award available through the publishers, W. W. Norton & Company, 70 Fifth Avenue, New York 11. The award consists of \$3,500, \$1,000 outright and the remainder as an advance against royalties. The contestant must be a professional worker in the field of medicine or may be two or more authors writing in collaboration, either of whom is a professional worker in the field of medicine. Subject matter may be autobiography, biography, history of any phase of medicine or the exposition of medical science or of medical theory. Additional information may be obtained from W. W. Norton & Company. Dr. Carl A. L. Binger, New York, was the recipient of the first award for his work on "The Doctor's Job" (*THE JOURNAL*, January 20, p. 175).

Meetings Canceled.—The Third War Conference on Industrial Medicine and Postwar Planning, scheduled for April 23-28 at the Drake Hotel, Chicago, has been canceled. *Industrial Hygiene News Letter* reports that, as far as is known at this time, none of the five associations which had planned to meet in Chicago will be holding a national meeting during the year. These groups are the American Industrial Hygiene Association, American Association of Industrial Physicians and Surgeons, National Conference of Governmental Industrial Hygienists, American Association of Industrial Nurses and American Association of Industrial Dentists. The Southwestern Medical Association has canceled its annual meeting, which was scheduled for Paducah, Ky., in May, the *Paducah Press* reported March 2. The meeting of the American Association of Genito-Urinary Surgeons, which was tentatively scheduled for June 7-9 at Stockbridge, Mass., has been canceled.

Fellowships in Allergy Available.—The American College of Allergists announces that the medical graduate committee of the Mayo Foundation has approved the placing of a fellowship at the Mayo Clinic and the Mayo Foundation. The selection of a person to receive the fellowship will be

made by Dr. Charles F. Code, assistant professor of clinical physiology, at the medical school, foundation and clinic and the medical graduate committee of the University of Minnesota Graduate School, Rochester-Minneapolis. The stipend will be \$1,500 a year with provision for a continuation of the fellowship for a second year, if desirable. According to the *Annals of Allergy* the granting of such fellowship is necessarily postponed until or toward the end of the war because Dr. Code is at present engaged in full time war research. Another fellowship has been created by the college of allergists to continue for two years and will be used to augment research directed at gaining fundamental knowledge necessary for the development of satisfactory methods for the standardization of allergenic extracts. Information concerning this fellowship may be obtained from Dr. George E. Rockwell, 2500 Melrose Avenue, Cincinnati 6.

Narcotic Violations.—The U. S. Bureau of Narcotics announced the following violations of the federal narcotic law:

Dr. Paul H. Pernworth, Venice, Ill., fined \$1,500 and placed on probation for three years following his plea of guilty in the U. S. District Court at Springfield, Ill.

Dr. John Henry Lee-Staples, Afton, Okla., received a suspended sentence of three years and was placed on probation for a similar period.

Dr. Alvin Schuman, Brooklyn, sentenced to a term of two and one-half years following his plea of *nolo contendere* in the U. S. District Court at Brooklyn.

Dr. William H. Goldschmidt, alias Hilarius W. Goldsmith, Wilhem Goldschmidt and Vidor Goldschmidt, an alien, New York, sentenced to imprisonment for eighteen months and placed on probation for a period of two years to begin after completion of the sentence following his plea of guilty in the U. S. District Court in the southern district of New York.

Dr. Gaston B. Justice, Asheville, N. C., pleaded guilty to an indictment containing three counts; he was fined \$300 on count one and judgment was suspended on counts two and three until the May 1945 term of court.

Dr. David J. Simpson, Lakeland, Fla., received a suspended sentence of two years Nov. 23, 1944 and was placed on probation for two years following his *nolo contendere* plea in the U. S. District Court of attempt to violate the federal narcotic law.

Dr. Nicholas A. Tonis, New York, received, Dec. 5, 1944, a suspended sentence of one year and one day in prison following his plea of guilty to violation of the federal narcotic law and was placed on probation for two years and fined \$500.

Million Dollars for Program in Physical Medicine.—

The National Foundation for Infantile Paralysis has appropriated \$1,267,600 to train qualified physical therapists. Directed by a special committee in the field of physical therapy, the funds will be expended as follows: \$1,107,000 for scholarships to train new physical therapists, \$82,000 for fellowships to provide additional teachers and \$78,600 for general development of the field of physical therapy. The National Foundation, since it was organized in 1938, has expended up to now more than a million dollars in the development of the fields of physical medicine and physical therapy, according to a release March 19. The new program is designed to provide urgently needed personnel necessary to fulfilling the National Foundation's pledge that complete medical care will be assured, so far as possible, for infantile paralysis victims, regardless of age, race, creed, color or lack of financial ability to pay for services rendered. The special committee formed to assist in the development of the new program includes the following:

Dr. Irvin Abell, Louisville, Ky., chairman.

Dr. Donald B. Armstrong, New York, second vice president, Metropolitan Life Insurance Company.

Dr. Max M. Peet, Ann Arbor, Mich., chief, neurosurgical section, University Hospital, and professor of surgery, University of Michigan Medical School.

Dr. Morris Fishbein, Chicago, editor of *THE JOURNAL*.

Dr. Arthur L. Watkins, Boston, director of the department of physical therapy, Massachusetts General Hospital.

Dr. Melbourne G. Westmoreland, Chicago, staff, Council on Medical Education and Hospitals, American Medical Association.

Miss Jessie Stevenson, New York, president of the American Physiotherapy Association.

Miss Lucille Daniels, acting director, division of physical therapy at Stanford University, Stanford University, Calif.

Dr. Don W. Gudakunst, New York, medical director, National Foundation for Infantile Paralysis.

Basil O'Connor, L.L.D., New York, president, National Foundation for Infantile Paralysis.

Miss Catherine Worthingham, New York, director of technical education, National Foundation for Infantile Paralysis.

Preparation for entrance into approved schools of physical therapy requires graduation as a nurse, or physical educator, or two years' college training, including biology and other basic sciences. Applications for scholarships should be made to the National Foundation for Infantile Paralysis, 120 Broadway, New York 5, or to the American Physiotherapy Association, 1790 Broadway, New York 19.

LATIN AMERICA

Health Activities in Latin America.—Information Booklets for Biologists.—

The Union of American Biological Societies has published booklets dealing with graduate instruction and research in the biologic sciences in the United States for distribution to biologists and biologic centers throughout the

Latin American republics. Science Service has cooperated in the printing and distribution of the booklets. Any one in the United States desiring a copy of either the Spanish or Portuguese booklet may secure one from Elmer G. Butler, Ph.D., president of the Union of American Biological Societies, Princeton University, Princeton, N. J.

Congress Against Tuberculosis.—

Dr. Ovidio Garcia Rosell, Lima, Peru, was elected president of the Pan American Congress Against Tuberculosis which was held in Havana, Cuba, January 15-21. Dr. Juan J. Castillo Arango, professor of medicine, University of Havana, Cuba, as president of the recent congress, presided over the scientific sessions and Dr. Antonio Navarrete, Sierra, assistant professor of medicine, presided over the business session. Among the speakers at the congress were:

Capt. Sol Roy Rosenthal, M. C., Reports of the Results of BCG Vaccination.

Dr. Leo Eloesser, San Francisco, Tuberculous Suppurations and Extra-pulmonary Fistulas in the Trachea and Bronchi.

Herman E. Hilleboe, Medical Director, U. S. Public Health Service, Objectives of Tuberculosis Control of the U. S. Public Health Service.

Dr. Chevalier L. Jackson, Philadelphia, The Anatomical Relationship of the Bronchus and Lungs from the Viewpoint of the Bronchoscopist.

Other representatives from the United States included Dr. J. Winthrop Peabody, Washington, D. C., and Mr. Murray Kornfeld, Chicago, immediate past president and executive secretary respectively of the American College of Chest Physicians.

Campaign Against Leprosy.—

Colombia will carry out an extensive campaign against leprosy this year at an estimated cost of 3,000,000 pesos, according to a newspaper report, February 9. Existing facilities will be improved and a colony for 1,000 leprosy patients will be established in the state of Santander, with special plans for the care of the children. Specialists in leprosy will be sent to the United States and Brazil for further study, the New York Times announces.

Personal.—

Dr. Nicolau Moraes Barros, São Paulo, Brazil, has been named research fellow of the Rockefeller Foundation on the staff of Harvard Medical School, Boston.

FOREIGN

Personal.—

Dr. Daniel Fowler Cappell, professor of pathology at the University of St. Andrews since 1931, has been appointed to the chair of pathology at the University of Glasgow, in succession to the late Dr. John Shaw Dunn.—Sir John Boyd Orr has resigned as director of the Rowett Research Institute, Bucksburn, Aberdeenshire. The position also carries the directorship of the Imperial Bureau of Animal Nutrition and the joint editorship of *Nutrition Abstracts and Reviews*.

Research Institute to Be Named for Scientist.—

Plans to establish in Palestine the Weizmann Institute of Science as a tribute to Chaim Weizmann, Sc.D., were announced on his seventieth birthday recently. The institute, if plans proceed, will be composed of four departments devoted to research in the fields of physical chemistry, pharmacology and chemotherapy, plastics and nutrition. Dr. Weizmann is director of the Daniel Sieff Research Institute in Rehovoth, Palestine.

Prizes Offered.—

During the All-India Medical Conference in Cawnpore during the Christmas holidays, three prizes will be awarded, according to the *Journal of the Indian Medical Association*. A gold medal has been offered by Dr. Kumud S. Ray, Calcutta, ex-president of the association, for the best paper on puerperal sepsis. Capt. Kalidas L. Saha has offered a gold medal for the best paper on any subject in pharmacology, and Kaisar-i-Hink of Jamalpur has offered a gold medal in memory of his deceased son, Dr. Satyendra N. Sen, for the best paper on "intestinal obstruction and other complications of appendicitis, how to prevent and treat such complications and save the patients from the cruel sufferings and death."

New Dutch Medical Association.—

In anticipation of the tremendous demands that will be made on the medical profession of the Netherlands when the still occupied provinces will have been freed and immediate alleviation must be brought to millions of victims of frost and famine, the physicians in the liberated area have formed an association to centralize their functions for a speedy rehabilitation of public health, according to the Netherlands Information Bureau. A central medical information bureau has now been established in Tilburg, in North-Brabant province, while a fortnightly periodical, *Medisch Contact* (Medical Contact), will keep the members of the new organization informed regarding health conditions as they will be found in the northern provinces. At the same time the association will represent the physicians in matters of an economic nature.

LONDON

(From Our Regular Correspondent)

Feb. 24, 1945.

A Faculty of Ophthalmologists

The Council of British Ophthalmologists has resolved that there is need for an authoritative and representative body to guide ophthalmologists through the intricate and important problems to be settled in the near future, to represent their interests to the state and to coordinate their efforts, so that in the coming reorientation of the medical service of the country the greatest good may accrue to the people, while at the same time the interests of the profession may be preserved. Although circumstances may necessitate that changes be gradual, fundamental principles are now being evolved which will profoundly affect the medical profession and the community at large. For the ophthalmologic services the alternative is to have policies imposed by others or to establish an authoritative body able to initiate and criticize policy.

Some of the immediate problems which require examination and early solution are of great moment. The government's proposal for a national health service deals vaguely with ophthalmologic service, although it is clear that it intends to establish such a service. The Council of British Ophthalmologists proposes the establishment of a Faculty of Ophthalmologists which would have more weight than itself if made more directly representative of the whole body of ophthalmologists in the country. It will be the first task of the faculty to examine the many questions arising in connection with the government's scheme. Its aim will be, in collaboration with the appropriate ministries and other bodies concerned, to play an important part in determining the form which the ophthalmologic service will take. This raises questions not only of conditions of service but of the relation of the ophthalmologist to the dispensing and sight testing opticians, the methods of lens supply and the establishment and control of clinics. In addition to these medico-political matters the questions of education and research, clinic and hospital policy, industrial and other problems will assume importance in the immediate future.

The functions of the faculty will be (1) to encourage suitable standards of education in ophthalmology for undergraduate and postgraduate students, (2) to encourage research in ophthalmology and cognate subjects, (3) to secure such conditions in ophthalmic practice as will attract persons of high professional attainments and afford ample scope for the exercise of their abilities, (4) to maintain a high ethical standard and (5) to act as an authoritative body for consultation in matters of ophthalmologic interest. The faculty will consist of members and associates. Only ophthalmologists of full consultant status will be eligible for membership. They shall be (1) ophthalmologic surgeons to hospitals recognized as schools of ophthalmology by universities or other medical examining bodies, (2) other ophthalmologic surgeons who have been engaged for at least five years in full time practice as specialists approved by the council (provisionally these shall be general hospitals of more than 200 beds), (3) those who have retired from the appointments specified and (4) other ophthalmologic surgeons of consultant rank approved by the council, including those in the services or holding government appointments. For associate, any ophthalmologist who has been in at least two years full time practice as a specialist will be eligible. It is anticipated that the new faculty will work in cooperation with the universities and medical corporations.

Jobs for Those Disabled in Fighting for Their Country

An appeal that special consideration be shown men and women disabled in the country's service was made by Mr. Bevin, minister of labor, at a luncheon commemorating the silver jubilee of the National Industrial Council for Road Transport Industry. Mr. Bevin said that veterans may not be able to adjust themselves at once to the conditions which they will find when they return. In particular the disabled man or woman presents a difficult problem. The Ministry of Labor has done what it could to insure that industry take a proper proportion of such men and women, and Bevin felt entitled to ask that management should make a special study of the problem. A man with only one leg, for instance, could be a very good driver if properly trained, and experience had shown that those in other ways physically handicapped could do a good deal. In the road transport industry certain standards of fitness were laid down, but he hoped that exceptions would be made in the case of disabled veterans. If training or specialist treatment was needed to make such persons fit for work, the Ministry of Labor would be willing to cooperate. He had arranged for wide research to discover how persons with every possible type of disablement could be provided with a place in industry, for his experience has shown that the higher the skill and the more effective the occupation such persons could acquire, the more they were helped to conquer their disability.

Sir Henry Gauvain

Sir Henry Gauvain, a pioneer in the treatment of surgical tuberculosis, has died. Born in 1878, he received his medical education at St. Bartholomew's Hospital and qualified in 1906. Not long after he qualified he was appointed the first medical superintendent of the home for children suffering from surgical tuberculosis, founded at Alton by Lord Mayor Treloar. He soon showed his originality by objecting to the term "surgical tuberculosis," pointing out that the disease was a general one requiring general treatment—"life in the open air, far from towns, in a dust and germ free atmosphere and under the bactericidal and tonic action of the sun." He drew attention to the model provided by the treatment at Berck-sur-Mer on the French coast, which he visited. With the traditional conservatism of this country, many of the distinguished physicians and surgeons of the day opposed his innovations, but he prevailed. He thought that the best results could be obtained by having two conjoined establishments, one in the country, the other at the seaside. This plan was realized when his hospital opened a seaside branch. After the first world war he spent much of his time in traveling and lecturing. In 1926 he lectured in the United States and Canada, and in 1936 he received the Distinguished Service Gold Key of the American Congress of Physical Therapy. In 1935, when the British Medical Association met in Australia, he was president of the Section of Tuberculosis and Public Health.

Marriages

JOHN WINTHROP PENNOCK, Syracuse, N. Y., to Mrs. Mary Farrand Hall of New York in Berkeley, Calif., February 9.

EDWARD JAMES MORTFELL, Oshkosh, Wis., to Miss Frances Carrington Ellis of Waynesboro, Va., December 16.

M. HERBERT BARKER to Miss Marjorie Leigh, both of Chicago, in Washington, D. C., in February.

CLINTON CHILDS HOPTON JR., Pendleton, S. C., to Miss Rebecca Lane of Atlanta, Ga., December 17.

FRED CAPLTON McCALL, Norton, Va., to Miss Evelyn Marguerite Carter of Farmville, January 1.

Deaths

Charles McDaniel Rosser ☉ Dallas, Texas, medical educator and organizer, died at the Gaston Hospital January 27, aged 83.

Dr. Rosser was born in Cuthbert, Ga., Dec. 24, 1862. He studied at the East Texas Academic Institute and graduated at the University of Louisville Medical Department in 1885. Fortified with an ambition to become a doctor of medicine, Dr. Rosser entered a junior clerkship in a Pittsburg, Texas, drugstore, where the owner, a physician, lent him books and periodicals for study. He later became a "traveling salesman" and school teacher to obtain money for further study. In his autobiography, "Doctors and Doctors," Dr. Rosser attributed much of his zeal to a country practitioner who took him for a companion during the progress of his learning "to see the practice of medicine from the inside." After his graduation Dr. Rosser started practice in Waxahachie, Texas, later moving to Dallas, where he soon became city health officer and superintendent of the North Texas Hospital for the Insane at Terrell. In 1900 he led a movement to establish a medical college in Dallas, which resulted in the organization of the Medical Department of the University of Dallas, now known as Baylor University School of Medicine, where for many years he served as professor of clinical surgery, later becoming emeritus. He was the founder of the Good Samaritan Hospital, which later became a teaching unit of Baylor.

Always an active organizer, Dr. Rosser was one of those instrumental in founding in 1906 the Medical Association of the Southwest, of which he was the first president. This association, covering the states of Missouri, Kansas, Arkansas, Oklahoma and Texas, was later taken over by the newer founded Southern Medical Association. He was also active in the creation of the Dallas Southern Clinical Society. He was once president of the North Texas Medical Association, of the Dallas County Medical Society, an officer of the Southern Surgical and Gynecological Association and chairman of the state board of health. Shortly after his graduation from medical school he became interested in the activities of the Texas State Medical Association, subsequently participating on committees and holding such offices as the vice presidency and presidency. In 1923, as the result of his energies as chairman of a council on legislation and public instruction of the state society, when he directed a statewide educational campaign against quackery, an amendment was added to the state medical practice act providing an injunction against illegal practitioners. In 1929 and 1931 Dr. Rosser was a member of the House of Delegates of the American Medical Association.

In 1923 at a public gathering he was presented with a silver loving cup to mark his contribution to state health. The occasion observed also the celebration of the opening of the Medical Arts Building in Dallas, a project promoted by a committee of which Dr. Rosser was chairman. In 1930 special ceremonies marked the presentation of a portrait to Baylor to pay tribute to its founder.

Ira Frank ☉ Highland Park, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1899; specialist certified by the American Board of Otolaryngology; member and in 1936-1937 president of the American Laryngological, Rhinological and Otolological Society; member of the American Academy of Ophthalmology and Otolaryngology, Chicago Medical Society, Institute of Medicine of Chicago, Chicago Laryngological and Otolological Society and the Society of Medical History of Chicago; corresponding member of the Société de Laryngologie des Hôpitaux de Paris; fellow of the American College of Surgeons; served as attending otolaryngologist at the Grant Hospital in Chicago and consulting otolaryngologist to the Michael Reese Hospital and the Sarah Morris Hospital for Children, Chicago; died January 20, aged 67, of coronary occlusion.

Sigmund Krumholz ☉ Chicago; University and Bellevue Hospital Medical College, New York, 1899; professor and chairman of the department of neurology, Cook County Graduate School of Medicine; formerly assistant and associate professor of neurology at Northwestern University Medical School; served as assistant of nervous and mental diseases at Rush Medical College and associate in nervous diseases at the West Side Dispensary of the United Hebrew Charities; member of the Chicago Neurological Society; on the staffs of the Cook County and Mount Sinai hospitals; consulting neurologist and psychiatrist at the Orthodox Jewish Old Peoples Home; died January 26, aged 73, of coronary thrombosis and coronary sclerosis.

William Freas Confair, Benton, Pa.; University of Pittsburgh School of Medicine, 1932; fellow of the American College of Physicians; member of the American Medical Association; interned at the U. S. Marine Hospital, Norfolk, Va.; served on the associate staffs of the Bloomsburg Hospital, Bloomsburg, and the Berwick Hospital, Berwick; commissioned a first lieutenant in the medical reserve corps of the U. S. Army June 9, 1932; began active duty as a captain on Dec. 26, 1940 and later became a major; honorably discharged because of physical disqualification, Oct. 25, 1943; died in the George F. Geisinger Memorial Hospital, Danville, January 14, aged 36, of cerebral hemorrhage.

Henry R. Boettcher ☉ Chicago; the Hahnemann Medical College and Hospital, Chicago, 1890; Harvey Medical College, Chicago, 1896; at one time associate in ophthalmology and instructor (extramural) in laryngology and otology at Rush Medical College; formerly on the staffs of the Illinois Charitable Eye and Ear Infirmary and the Central Free Dispensary; trustee, member and past president of the staff of the Englewood Hospital; eye surgeon for the Wabash Railroad; served as a director of the First National Bank of Englewood; died February 5, aged 78, of uremia and hypertensive heart disease.

Julius Ernest Lackner ☉ Chicago; Rush Medical College, Chicago, 1910; formerly on the faculty of his alma mater; specialist certified by the American Board of Obstetrics and Gynecology, Inc.; served as president and secretary of the Chicago Gynecological Society; member of the Central Association of Obstetricians and Gynecologists; fellow of the American College of Surgeons; on the staffs of the Michael Reese Hospital and the Highland Park (Ill.) Hospital; died at his home in Highland Park, January 3, aged 57, of coronary thrombosis.

William Alfred Ackroyd ☉ Binghamton, N. Y.; Albany Medical College, 1913; served during World War I; member of the Endicott Johnson Medical Department; on the staff of the Wilson Memorial Hospital, Johnson City, where he died February 9, aged 58, of aneurysm of the aorta.

Walter S. Alexander, Fond du Lac, Wis.; the Hahnemann Medical College and Hospital, Chicago, 1898; died November 5, aged 71, of arteriosclerosis and nephritis.

Anna L. Allaben, Morristown, N. J.; New York Medical College and Hospital for Women, Homeopathic, New York, 1894; for many years president of the local board of health and school physician; on the staff of the All Souls Hospital, where she died January 2, aged 86, of myocarditis and carcinoma of the descending colon.

Ralph Willis Atwater ☉ Syracuse, N. Y.; Cornell University Medical College, New York, 1904; on the staff of the Crouse-Irving Hospital, where he died December 9, aged 63, of coronary thrombosis.

Caroline Marcy Baldwin, Rochester, Pa.; Woman's Medical College of Pennsylvania, Philadelphia, 1901; member of the American Medical Association; died November 10, aged 65, of cerebral embolism and arteriosclerotic heart disease with auricular fibrillation.

Fredrick Dale Barker, Granville, Ohio; University of Pennsylvania Department of Medicine, Philadelphia, 1890; during World War I served overseas as a captain in the Red Cross; formerly chief of staff, Miami Valley Hospital, and division surgeon for the Baltimore and Ohio Railroad in Dayton; since 1914 trustee of Denison University; at one time chairman of the board of public works; developed a water system for Granville; died January 16, aged 84, of chronic myocarditis with anasarca.

Virgil F. Barker, Cincinnati; Medical College of Ohio, Cincinnati, 1900; served during World War I; died in the Cincinnati General Hospital January 9, aged 67, of cerebral thrombosis and hypertensive cardiovascular disease.

Albert Armington Barrows ☉ Providence, R. I.; Harvard Medical School, Boston, 1902; member of the New England Surgical Society; fellow of the American College of Surgeons; member of the founders group of the American Board of Surgery; on the courtesy staff, South County Hospital, Wakefield; consulting surgeon, Westerly Hospital, Westerly, and Providence City Hospital; died October 9, aged 66, of coronary occlusion.

Charles Barton, Los Angeles; Detroit Homeopathic College, 1909; served as assistant city health officer; served during World War I; died recently, aged 63.

Harry Baum, St. Joseph, Mo.; University Medical College of Kansas City, Mo., 1900; veteran of the Spanish-American War; died in the Missouri Methodist Hospital December 30, aged 64, of lobar pneumonia.

Edward C. Beck, St. Louis; St. Louis College of Physicians and Surgeons, 1896; on the staffs of the Deaconess Hospital, Josephine Heitkamp Memorial Hospital and the Alexian Brothers' Hospital, where he died January 4, aged 80, of carcinoma of the prostate, cerebral hemorrhage and pneumonia.

Robert Marvin Benson, Carrollton, Mo.; University Medical College of Kansas City, 1905; died January 3, aged 62, of cerebral hemorrhage.

Martin Biederman Ⓢ New York; Columbia University College of Physicians and Surgeons, New York, 1922; on the staffs of St. Elizabeth's Hospital, Gouverneur Hospital and St. Clare's Hospital, where he died January 7, aged 46, of bronchopneumonia.

Junius S. Billings, White Hall, Ill.; American Medical College, St. Louis, 1896; member of the American Medical Association; died January 13, aged 77, of cerebral hemorrhage.

Oscar W. Bonner, Delaware, Ohio; Columbus Medical College, 1892; member of the draft board during World War I; formerly member of the board of health; died December 11, aged 74.

Alfred Joseph Bonneville Ⓢ Hatfield, Mass.; College of Physicians and Surgeons, Boston, 1904; Medico-Chirurgical College of Philadelphia, 1911; district supervising censor of the Massachusetts Medical Society for many years; on the staff of the Cooley Dickinson Hospital, Northampton, where he died January 11, aged 73, of heart disease.

Josiah Slicer Bowen, Baltimore; University of Maryland School of Medicine, Baltimore, 1903; served as deputy state health officer of the state department of health and as head of the Baltimore County Health Department; past president of the Medical and Chirurgical Faculty of Maryland; died October 20, aged 62, of coronary thrombosis.

William W. Bowen, Fort Dodge, Iowa; State University of Iowa College of Medicine, Iowa City, 1895; fellow of the American College of Surgeons; formerly vice president and in 1933 president of the Iowa State Medical Society; past president of the Webster County Medical Society, Iowa X-Ray Club and the Austin-Flint and Twin Lakes Medical Societies; member of the staffs of the Lutheran Hospital and St. Joseph Mercy Hospital, where he died December 20, aged 75, of cerebral arteriosclerosis and progressive cerebral thrombosis.

Daniel W. Bowers, Calhoun, Ill.; Barnes Medical College, St. Louis, 1895; died in the Olney Sanitarium, Olney, January 16, aged 83, of carcinoma of the urinary bladder.

Harvey Christian Bowers, Akron, Ind.; St. Louis University School of Medicine, 1902; died in St. Joseph Memorial Hospital, Kokomo, February 11, aged 70, of injuries received when the automobile in which he was driving was struck by a truck.

Claude McKinley Burpee Ⓢ Augusta, Ga.; University of Georgia School of Medicine, Augusta, 1922; professor of pediatrics at his alma mater; member of the American Academy of Pediatrics; specialist certified by the American Board of Pediatrics, Inc.; formerly served an internship and residency at St. Louis Children's Hospital; pediatrician in chief at the University Hospital, where he had served as intern and resident; died December 2, aged 47, of coronary thrombosis.

George Verne Buxton, Milwaukee; University of Arkansas School of Medicine, Little Rock, 1927; served during World War I and on the staffs of various Veterans Administration facilities; died November 21, aged 51, of cerebral hemorrhage and hypertension.

Omer U. Carl Ⓢ Peru, Ind.; Miami Medical College, Cincinnati, 1896; served for two terms as a member of the school board; on the staff of the Dukes-Miami County Memorial Hospital, where he died January 14, aged 72, of perforated gastric ulcer.

John J. Cavanaugh Ⓢ Fort Scott, Kan.; John A. Creighton Medical College, Omaha, 1898; died in St. Elizabeth's Hospital, Hutchinson, January 28, aged 76, of coronary thrombosis.

Lee Roy Colby, Norborne, Mo.; Missouri Medical College, St. Louis, 1899; died January 7, aged 87, of cerebral hemorrhage.

Norman V. Collins, Griffin, Ga.; Georgia College of Eclectic Medicine and Surgery, Atlanta, 1910; died November 24, aged 55.

George Henry Joseph Copia, Chicago; Loyola University School of Medicine, Chicago, 1918; on the staff of St. Bernard's Hospital, where he died January 31, aged 50, of coronary thrombosis and hypertension.

Thomas Benton Cox, Lawndale, Calif.; Baltimore Medical College, 1894; died December 24, aged 77.

George Anderson Crafton, Fulton, Ky.; Vanderbilt University School of Medicine, Nashville, Tenn., 1913; member of the American Medical Association; served during World War I; died December 17, aged 56.

William Clapp Cuthbert Ⓢ Hudson Falls, N. Y.; Albany Medical College, 1897; for many years coroner of Washington County; health officer of the town of Kingsbury; formerly on the staff of the Glens Falls Hospital, Glens Falls, where he died January 14, aged 71, of coronary thrombosis.

Ernest Napoleon D'Alcorn Ⓢ Muskegon, Mich.; University of Illinois College of Medicine, Chicago, 1922; fellow of the American College of Surgeons; past president of the Muskegon County Medical Society; on the staff of the Mercy Hospital; interned at the Metropolitan Hospital, Welfare Island, N. Y., and at the Hackley Hospital, at whose school of nursing he lectured and where he was a staff member and where he died January 19, aged 48, of carcinoma of the sigmoid.

Thomas Stevenson Dunning, Philadelphia; Hahnemann Medical College of Philadelphia, 1870; formerly on the staff of the Children's Homeopathic Hospital; on Jan. 10, 1940 had been honored by the Dickinson Club of Philadelphia as the oldest living alumnus of Dickinson College, having graduated in 1867; died January 12, aged 96.

William Murray Edmonds, Tonawanda, N. Y.; University of Buffalo School of Medicine, 1916; served overseas during World War I; for many years member of the board of health; member of the staff of the DeGraff Memorial Hospital, North Tonawanda; died January 11, aged 54, of coronary occlusion, chronic asthma and pulmonary emphysema.

George Potter Edwards, Myrtle Point, Ore.; University of Georgia Medical Department, Augusta, 1902; served as acting assistant surgeon in the U. S. Public Health Service; died in December, aged 76.

Harry Bennett Felts Ⓢ Salt Lake City; Rush Medical College, Chicago, 1907; also a pharmacist; served during World War I; on the staff of St. Mark's Hospital; died in the Holy Cross Hospital January 14, aged 65, of coronary occlusion.

Edward Newton Flowers, Clarksburg, W. Va.; College of Physicians and Surgeons, Baltimore, 1893; member of the American Medical Association and honorary member of the West Virginia State Medical Association; honorary member and past president of the Harrison County Medical Society; for many years a member of the school board; one of the founders of the Harrison County Hospital, now known as St. Mary's Hospital; died January 25, aged 78, of cerebrovascular arteriosclerosis and bronchopneumonia.

John Albert Flury Ⓢ St. Louis; Washington University School of Medicine, St. Louis, 1912; served during World War I; formerly on the staff of the Deaconess Hospital; died in Colorado Springs, Colo., January 9, aged 58, of heart disease.

James I. Foster, Huntsville, Tenn.; Tennessee Medical College, Knoxville, 1901; member of the American Medical Association; for many years county health officer; died December 8, aged 69.

Jacob H. Garey, Berlin, Pa.; Jefferson Medical College of Philadelphia, 1885; died in the Somerset Community Hospital, Somerset, November 9, aged 93, of hypertrophy of the prostate and chronic cystitis.

Montgomery G. Gearhart Ⓢ Millerstown, Pa.; University of the South Medical Department, Sewance, Tenn., 1901; died January 16, aged 72, of coronary occlusion.

Ludie Thamil Gilmer Ⓢ Milwaukee; Meharry Medical College, Nashville, Tenn., 1918; died January 12, aged 51, of carcinoma of the stomach.

P. M. Girard, Lafayette, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1882; on the staff of the Lafayette Sanitarium; died December 11, aged 85.

Warren D. Gray, Mason, Tenn.; Memphis Hospital Medical College, 1884; died December 17, aged 79.

James Harry Hendren, Balkan, Ky.; Hospital College of Medicine, Louisville, 1902; served as secretary of the Cumberland Valley Medical Association; died in the Middlesboro Hospital, Middlesboro, December 16, aged 71.

Oscar Henry Henninger, Ironton, Ohio; Pulte Medical College, Homeopathic, Cincinnati, 1909; member of the American Medical Association; for many years a member of the city council; served overseas during World War I; on the staff of the Lawrence County General Hospital; surgeon, Mount Vernon Bridge Company; died December 26, aged 58, of coronary occlusion and chronic myocarditis.

Claiborne Steele Hyland, Yokena, Miss.; Medical Department of Tulane University of Louisiana, New Orleans, 1894; died in Vicksburg December 22, aged 85.

Jay Arthur Jones, Kansas City, Kan.; College of Physicians and Surgeons, Medical Department, Kansas City University, Kansas City, 1904; member of the American Medical Association; past president and secretary of the Wyandotte County Medical Society; died in the Bethany Hospital December 26, aged 65.

Nathaniel Aloysius Jones, Oklahoma City; Baylor University College of Medicine, Dallas, Texas, 1940; interned at the Toledo Hospital, Toledo, Ohio, and the Brackenridge Hospital, Austin, Texas; reported for active duty as a captain in the medical corps, Army of the United States, on May 14, 1942 and was honorably discharged by reason of physical disqualification on Oct. 3, 1943; died in November, aged 28.

Joseph R. Keller, Sulphur, Okla. (licensed in Oklahoma under the Act of 1908); died November 9, aged 75.

Ellis W. Kelly, Toledo, Ohio; Toledo Medical College, 1897; on the staffs of the Flower Hospital, Women's and Children's Hospital, Toledo Hospital and St. Vincent's Hospital, where he died December 19, aged 76.

Melvin Edwin Koenig, Buffalo; University of Toronto Faculty of Medicine, Toronto, Ont., Canada, 1931; served an internship at the Moses Taylor Hospital, Lackawanna, N. Y.; examining physician for the Bethlehem Steel Company; began active duty as a first lieutenant in the medical corps, Army of the United States, on Feb. 25, 1944; received a medical discharge for physical disability on Dec. 4, 1944; died in the Meyer Memorial Hospital December 12, aged 38.

Irving Nelson Kohler, Middleport, N. Y.; University of Buffalo School of Medicine, 1912; member of the American Medical Association; health officer of the town of Hartland; died December 29, aged 69, of coronary occlusion.

Bertram Oliver Kreilick ♂ Fremont, Ohio; Ohio Medical University, Columbus, 1907; for twenty-two years a member and for nineteen years president of the school board; on the staff of the Memorial Hospital, where he died December 30, aged 61, of coronary thrombosis.

John V. Lewis, Momence, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1895; at one time mayor of Momence; died in the Manteno State Hospital, January 3, aged 77, of cerebral anemia and coronary sclerosis.

Irving Phillips Lyon ♂ Buffalo; Johns Hopkins University School of Medicine, Baltimore, 1897; an Affiliate Fellow of the American Medical Association; formerly associate professor of medicine and librarian at the University of Buffalo School of Medicine; member of the American Association of Pathologists and Bacteriologists; served during World War I; for many years on the staff of the Buffalo General Hospital and Buffalo City Hospital; died November 11, aged 74.

William Dunsford Lyon ♂ Andalusia, Ala.; Western Reserve University Medical Department, Cleveland, 1900; specialist certified by the American Board of Pediatrics, Inc.; member of the American Academy of Pediatrics; formerly pediatric consultant to the bureau of maternal and child health of the state department of health; at one time health officer of Grass Lake, Mich., and assistant in pediatrics at the University of Michigan Medical School, Ann Arbor; died in Tucumcari, N. M., December 9, aged 69.

Charles Elmer Magoun, Sioux City, Iowa; Tufts College Medical School, Boston, 1915; member of the American Medical Association; served during World War I; died in Salem, Va., December 18, aged 56.

Benjamin Harry Mann ♂ Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1907; specialist certified by the American Board of Ophthalmology; member of the American Academy of Ophthalmology and Otolaryngology and the Association for Research in Ophthalmology, Inc.; fellow of the American College of Surgeons; ophthalmologist at the Methodist Hospital; died in the Graduate Hospital November 22, aged 58.

William Richard McAtee, Erie, Pa.; University of Buffalo School of Medicine, 1930; interned at the Hamot Hospital, where he died November 9, aged 40, of heart disease.

Charles Stanhope Means, Fort Smith, Ark.; University of Arkansas School of Medicine, Little Rock, 1909; member of the American Medical Association; past president of the Sebastian County Medical Society; died November 21, aged 63.

William Alvie Moffitt, Paducah, Ky.; University of Louisville Medical Department, 1903; died in the Riverside Hospital November 25, aged 72, of chronic myocarditis.

Cora Weber Negus, Keswick, Iowa; State University of Iowa College of Medicine, Iowa City, 1906; member of the American Medical Association; died November 14, aged 76.

Isaac Eugene Nervig, Sioux City, Iowa; State University of Iowa College of Medicine, Iowa City, 1902; fellow of the American College of Surgeons; served during World War I; died in Knoxville December 24, aged 70.

John William Noble ♂ Allentown, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1919; formerly deputy coroner and medical examiner at induction center; on the staffs of the Allentown and Sacred Heart hospitals; died January 3, aged 49, of uremia and hypertensive vascular disease.

John Coleman O'Gwynn, Mobile, Ala.; University of Tennessee Medical Department, Nashville, 1902; member of the American Medical Association; served during World War I; formerly associated with the U. S. Public Health Service; consultant on the staff of the U. S. Marine Hospital; died January 13, aged 65, of heart disease.

Harold Francis Parker, Waukesha, Wis.; Tufts College Medical School, Boston, 1909; awarded the Purple Heart for wounds received in action during World War I; clinical director of the Veterans Administration Facility; died in the Veterans Administration Facility, Wood, January 13, aged 62, of thrombosis of the left median cerebral artery with right hemiplegia and bulbar paralysis.

Harry Caldwell Parker, Gulfport, Fla.; Harvard Medical School, Boston, 1901; at one time instructor in ophthalmology at the Tufts College Medical School and on the staffs of the Massachusetts Charitable Eye and Ear Infirmary and St. Elizabeth's Hospital, all in Boston; served during World War I; died in the Veterans Administration Facility, Bay Pines, January 11, aged 67, of carcinoma of the left lung.

David H. Parmet ♂ Allentown, Pa.; Jefferson Medical College of Philadelphia, 1909; served as vice president of the Lehigh County Medical Society; on the staff of the Sacred Heart Hospital; died January 4, aged 64, of cerebral hemorrhage.

Frank Herbert Paterson, Santa Ana, Calif.; College of Physicians and Surgeons of San Francisco, 1898; served during World War I; at one time affiliated with the Columbia Hospital in San Jose; died January 3, aged 69, of pneumonia and encephalitic parkinsonism.

Claude Burton Paynter, Salem, Ind.; Louisville (Ky.) Medical College, 1906; member of the American Medical Association; organized the Washington County chapter of the American Red Cross in 1917, serving as its president; a lieutenant in the medical corps, 70th Field Artillery, during World War I; secretary and past president of the Washington County Medical Society; served as county coroner and as city and county health officer; acting surgeon for the Monon Railway Company; died January 8, aged 68, of angina pectoris.

William H. Perry, Flint, Mich.; Homeopathic Medical College of Missouri, St. Louis, 1898; died in the Hurley Hospital January 11, aged 75, of coronary thrombosis.

Alvin August Peterson, Mora, Minn.; Northwestern University Medical School, Chicago, 1916; died January 13, aged 53, of cerebral hemorrhage due to hypertension.

Charles LaFayette Plunkett, New York; Medical College of Virginia, Richmond, 1925; died in a local hospital in November, aged 46.

William H. F. Rhyne, LaFayette, Ga.; Vanderbilt University School of Medicine, Nashville, Tenn., 1891; University of Nashville Medical Department, 1891; died December 1, aged 81.

Joseph Rosenberg, New York; Long Island College Hospital, Brooklyn, 1909; past president of the Harlem Medical Association; formerly on the staffs of the West Side German, Mount Sinai, Lenox Hill, Sydenham, Jewish Memorial and Riker's Island hospitals; for many years director of the Jewish Social Service Association; examining physician for the Merchant Marine Service during World War I; died December 7, aged 68, of leukemia.

Guy Victor Rukke ♂ Colonel, U. S. Army, retired, Monterey, Calif.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1904; Army Medical School, 1907; entered the medical corps of the U. S. Army as a first lieutenant in 1907; promoted to captain in 1910, major in 1916, lieutenant in 1927 and retired with the rank of colonel June 30, 1933 for disability in line of duty; fellow of the American College of Surgeons; died in the Peninsula Community Hospital, Carmel, Calif., Nov. 16, 1943, aged 67.

Shibly Nassif Sallume, Albion, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1907; died in the James W. Sheldon Memorial Hospital January 12, aged 65, of cerebral hemorrhage.

Sarah Elizabeth Anna Schetky, Hood River, Ore.; Woman's Medical College of Pennsylvania, Philadelphia, 1900; died January 3, aged 83, of heart disease.

Jacob Everett Shearer, Phoenix, Ariz.; American Medical College, St. Louis, 1895; served during World War I; formerly health officer of Tillamook County, Ore.; served on the staffs of various Veterans Administration facilities; died December 13, aged 75, of coronary occlusion and arteriosclerosis.

Harlan Daniel Sheldon, Chicago; Bennett Medical College, Chicago, 1910; died February 4, aged 63, of chronic myocarditis and coronary occlusion.

Eugene Pardon Sisson * New Haven, Conn.; Harvard Medical School, Boston, 1918; member of the American Academy of Pediatrics and the Kansas Medical Society; assistant in the department of university health, Yale University; died January 27, aged 51, of purpura hemorrhagica.

Clinton H. Smith, Big Spring, Neb.; Lincoln Medical College, Eclectic, 1916; served as physician for the Union Pacific Railroad for many years; died December 29, aged 61.

Langdon Trufant Snipe * Bath, Maine; College of Physicians and Surgeons, New York, 1893; past president of the Maine Medical Association; on the staff of the Bath Memorial Hospital; served as bank president; died December 13, aged 77, of carcinoma of the sigmoid with metastasis to the liver.

Law Erskine Somers * Fort Wayne, Ind.; Indiana University School of Medicine, Indianapolis, 1917; died January 22, aged 56, of coronary heart disease.

Harold Carold Soucey * Fresno, Calif.; College of Medical Evangelists, Loma Linda and Los Angeles, 1928; died December 25, aged 50.

Annie Whitney Spencer, Batavia, Ill.; the Hahnemann Medical College and Hospital, Chicago, 1896; first woman president of the Illinois Homeopathic Medical Association in 1920; on the staff of the Bellevue Place Sanitarium, where she died December 18, aged 85.

James Malcolm Stallard, Sparta, Ky.; Kentucky School of Medicine, Louisville, 1898; died December 19, aged 74.

Lester Miles Stearns * San Diego, Calif.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1905; fellow of the American College of Surgeons; at one time instructor of anatomy at his alma mater; formerly on the staff of the Oak Park Hospital, Oak Park, Ill.; associated with the Consolidated Vultee Aircraft Corporation; died in the Scripps Memorial Hospital, La Jolla, January 4, aged 61, of meningitis.

James R. Stodghill, Lineville, Ala.; Southern Medical College, Atlanta, Ga., 1881; also a minister; died in December, aged 88.

Dwight Harold Stoughton * Hartford, Conn.; McGill University Faculty of Medicine, Montreal, Que., 1918; president and treasurer of the D. G. Stoughton Company, operators of drug stores in Hartford and West Hartford; died December 16, aged 52.

Francis Joseph Talbot * Niagara Falls, N. Y.; Baltimore Medical College, 1911; served during World War I; associate Fellow of the American College of Physicians; physician to Niagara University; psychiatrist, State of New York Department of Mental Hygiene; medical director, child welfare, and medical inspector, department of education; member of staffs of the Niagara Falls Memorial and Mount St. Mary's hospitals; medical examiner, Lehigh Valley Railroad; died in St. Joseph's Hospital, Buffalo, November 11, aged 58.

Van der Veer Taylor, Xenia, Ohio; Medical College of Ohio, Cincinnati, 1896; died January 13, aged 78, of cerebral hemorrhage.

William Ellwood Tew * Bessemer, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1903; for many years a member of the Michigan State Board of Registration in Medicine; served as president of the Upper Peninsula Medical Society; died December 25, aged 64.

Isaac Walton Thorne, San Francisco; Cooper Medical College, San Francisco, 1896; at one time instructor in surgery at his alma mater; member of the American Medical Association; past president and many times a member of the board of directors of the San Francisco County Medical Society; fellow of the American College of Surgeons; for many years chief surgeon at Mary's Help Hospital, where he died December 23, aged 72, of coronary obstruction.

Flora V. Woodward Tibbits, Boyne City, Mich.; the Hahnemann Medical College and Hospital, Chicago, 1906; died in Charlevoix January 4, aged 74, of organic heart disease.

E. A. Titel, Greenleaf, Wis.; Milwaukee Medical College, 1905; member of the American Medical Association; died in St. Vincent's Hospital, Green Bay, December 26, aged 68, of cardiac embolism and coronary sclerosis.

John Van Doorn, Marion, N. Y.; University of Buffalo School of Medicine, 1895; member of the American Medical Association; for many years coroner of Wayne County and health officer of Marion; died in Fairport, January 13, aged 77, of carcinoma of the lung.

Arthur Ward Van Riper * Passaic, N. J.; College of Physicians and Surgeons, New York, 1895; instructor in pediatrics at the New York Post-Graduate Medical School, New York, 1922-1923; for many years associated with the board of health; honorary member of the New Jersey Medical Society; president of the medical staff and senior staff pediatrician at the Passaic General Hospital, where he died December 22, aged 74, of chronic valvular heart disease.

John Asa Walker, Shawnee, Okla.; St. Louis College of Physicians and Surgeons, 1897; member of the American Medical Association and in 1910 member of the House of Delegates; past president of the Pottawatomie County Medical Society and for many years a member of the board of censors; formerly councilor of the Seventh District of the Oklahoma State Medical Association; served during World War I; on the staff of the Shawnee City Hospital; died December 23, aged 78, of intestinal obstruction.

Powhatan M. Waltrip Sr., Fort Worth, Texas; University of Louisville Medical Department, Louisville, Ky., 1898; died in St. Joseph's Hospital December 29, aged 70, of pneumonia and cerebral hemorrhage.

Emil Henry Webster * Sault Ste. Marie, Mich.; Trinity Medical College, Toronto, Ont., Canada, 1890; died January 19, aged 75, of chronic myocarditis and cerebral hemorrhage.

Albert Robert Weinglass, Chicago; University of Illinois College of Medicine, Chicago, 1941; interned at the Epworth Hospital in South Bend, Ind., and the Chicago Memorial Hospital; served an internship and fellowship in metabolism at the Michael Reese Hospital; research fellow in medicine at Harvard Medical School, Boston; teacher at the Thorndike Memorial Laboratory and resident in pathology at the Boston City Hospital, where he died January 3, aged 27, of diabetes mellitus.

Samuel Bernard Weiner * New York; Long Island College of Medicine, Brooklyn, 1934; specialist certified by the American Board of Pediatrics, Inc.; formerly resident in pediatrics at the Strong Memorial Hospital, Rochester, N. Y.; served an internship, a residency in pediatrics and as adjunct pediatrician at the Mount Sinai Hospital, where he died November 22, aged 33.

Hugh Judson Westgate, Rhinelander, Wis.; Wisconsin College of Physicians and Surgeons, Milwaukee, 1909; member of the American Medical Association; died January 2, aged 69, of coronary occlusion.

Malcolm Mackenzie Wickware, Detroit; Detroit College of Medicine, 1897; medical director of the Gleaner Life Insurance Society; died in the Highland Park General Hospital, Highland Park, December 9, aged 74.

George Thomas Williams * Crawfordsville, Ind.; Medical College of Indiana, Indianapolis, 1887; served during World War I; member of the medical staff of Culver Hospital, where he died, December 20, aged 79, of cerebral hemorrhage due to cardiorenal vascular disease.

Edwin G. Wilson, Jackson, Mich.; Michigan College of Medicine and Surgery, Detroit, 1903; member of the American Medical Association; died in New Port Richey, Fla., January 12, aged 67, of acute left ventricular cardiac failure and coronary thrombosis.

Adelaide Woodward, Seattle; Minneapolis College of Physicians and Surgeons, medical department of Hamline University, 1902; for her many years of service as a medical missionary in India was decorated by King George V of England; died January 7, aged 70.

Charles Edward Wright, Clear Lake, Iowa; State University of Iowa College of Medicine, Iowa City, 1898; member of the American Medical Association; died in Rose Hill December 21, aged 83, of carcinoma of the stomach.

Anna Rand Young, Stamford, Conn.; Tufts College Medical School, Boston, 1905; contract surgeon in the Office of the Surgeon General at Washington and director of U. S. Army laboratory technicians during World War I; died in the Stamford Hospital January 7, aged 70, of coronary disease.

Bureau of Investigation

BACKWARD GOES "SERUTAN"

Federal Trade Commission Calls Halt on the Advertising Claims

If you read it backward, "Serutan" is "Nature's"; its promoters apparently would have you believe that it is nature's way of curing constipation, giving you new life and "pep." Since 1935, and perhaps longer, Serutan has, in a manner of speaking, been getting into the public's hair, and perhaps, in a good many instances, also into its stomach and intestine.

An early advertising circular claimed: "Serutan is approved by such eminent authorities as . . . Victor H. Lindlahr." A picture of Lindlahr was associated with the somewhat amazing statement: "Eighteen years of study and investigation in the problems of health and disease give him a background which makes him peculiarly adapted for the great service he is now rendering countless thousands by his daily radio message on healthful living."

Where did Victor H. Lindlahr put in his "eighteen years of study and investigation in the problems of health and disease"? A search through the American Medical Association's exhaustive biographic records fails to show that he ever obtained a license to practice medicine in any state in the Union. The now defunct St. Louis College of Physicians and Surgeons reported him as one of its graduates in the class of 1917, though a picture of the class of 1923 included a person designated as "V. H. Lindlahr"! Regardless of which date is correct, his diploma from that school is no credit to him; the institution had an unsavory reputation long before it figured in the "diploma mill" scandal of 1923, after which its charter was revoked.

The records further show that the Chicago College of Osteopathy bestowed a diploma on Lindlahr in 1918 and that the state of Illinois granted him a license to practice osteopathy in the same year. As a dabbler in another field of "science" he obtained a license to practice "natureopathy" in Connecticut in 1931, but less than a year afterward that state revoked the license when the attorney general ruled that Lindlahr had not fulfilled the educational requirements for such license.

Some of Lindlahr's advertising that circulated in 1932 declared: "He was for six years chief of staff of the Lindlahr Sanitarium and is recognized as one of America's leading drugless physicians." Recognized by whom?

Besides the so-called Lindlahr Sanitarium, there was the high-sounding "Lindlahr College of Natural Therapeutics." These schools, appear to have been devoted to a variety of medical fads and were shepherded largely by Victor's father, Henry Lindlahr, M.D., possessor of a diploma from a "medical university" of dubious standing. After the father's death in 1924 the institutions were sold. The records indicate that for a time Victor remained in Chicago, giving "health lectures" and running a "health food" store and restaurant in Chicago. The scene next shifted to New York, where Victor took up the promotion of "patent medicines," apparently beginning with "Edrolax" and going on to "Kal," which was advertised as a calcium accessory to the diet. The government ruled that Kal was sold under fraudulent claims. Then Lindlahr found other nostrums to boost, such as "Hood-Lax" and "Serutan."

In New York Lindlahr also extended his "medical" activities to the literary field. First, it seems, he was president of a concern known as Lindlahr's Magazine, Inc. In 1932, the records indicate, the name was changed to Modern Living, Inc. This concern published a health-fad magazine, *Modern Living*, which Lindlahr was said to have edited until he organized another one of like nature, called the *Journal of Living*.

According to the Federal Trade Commission, Lindlahr has been employed by Healthaids, Inc., Jersey City, N. J., present manufacturer and distributor of Serutan, as a "health lecturer," actively promoting the sale of this nostrum to the public and receiving compensation from the company and the Journal of Living Publishing Corporation. Further, the Commission reported that Lindlahr is a director of the publishing concern, as are also two other persons, who are officers of the Healthaids outfit.

In October 1940 the Commission issued a complaint against Healthaids, Inc., the *Journal of Living* and its editor, Victor H. Lindlahr, for making misrepresentations for Serutan through advertisements in newspapers, periodicals, circulars and radio broadcasts.

In their reply the respondents denied that they had made the misrepresentations charged against them or that Lindlahr directs and controls the practices of Healthaids, Inc., and the Journal of Living Publishing Corporation with respect to the advertising of its preparations or otherwise, or that the respondents had acted in conjunction and cooperation with each other in carrying out the practices alleged in the complaint.

The case was submitted to hearings held intermittently over a period of years. Now it seems to have reached its conclusion in a Cease and Desist Order issued in January 1945 by the Commission. This directs the respondents to stop disseminating "any advertisement which represents directly or indirectly that Serutan (1) is a cure or remedy for constipation, will restore or maintain natural elimination, will promote normal or regular action by the digestive or eliminative organs or muscles, or has any therapeutic value in the treatment of constipation in excess of the temporary relief afforded by its laxative action; (2) will strengthen the digestive or eliminative organs or muscles; or (3) will stimulate the digestive or eliminative organs or muscles. (This last prohibition is not to be construed as prohibiting representations that Serutan tends to stimulate peristaltic action by the intestines.)"

With these misrepresentations barred from the advertising, how will the promoters of Serutan be able to sell enough to make it profitable? The Commission's order brought out the information that the nostrum consists of equal parts of rice polishings and the epithelial tissue of psyllium seed. Instead of its being a cure for constipation, its therapeutic value is "limited to the temporary relief afforded by its laxative action."

When taken as directed, Serutan acts as a mild irritant, bulk laxative. . . . A small portion of the indigestible residues of Serutan is broken down into volatile fatty acids which irritate the intestinal walls. The crude fibers contained in the rice polishings also have a direct irritant effect upon the intestinal walls. . . ."

This case is not the first action that the Federal Trade Commission has brought against Lindlahr and the Journal of Living Publishing Corporation. In 1943 it ordered them and Purity Products, Inc., distributors, to cease disseminating any advertisement which represented, among other things, that the product "V-Bev" had any value in the treatment of arthritis, nervousness, indigestion, sleeplessness, lack of energy, underweight or general run-down condition, or of any disease or condition caused by or associated with a vitamin B₁ deficiency.

Healthaids, Inc., individually, had a run-in with the Food and Drug Administration in 1934, when the latter seized an interstate shipment of the firm's "Lax-Aid" on the charge that the labels falsely represented, among other things, that this was not a seed product, whereas analysis had shown it to consist essentially of ground plantago seeds. Further, the government charged that the label fraudulently represented that the nostrum, by doing away with constipation, would thereby remove the cause of rheumatism, pyorrhea, diseased tonsils, colitis and "many other life-taking diseases." Healthaids, Inc., put up no defense in this case.

The airing of the decision in the Serutan case may cause many of the public to speculate as to how much they can believe of medical claims made over the radio. Nostrum promotion in newspaper and magazine advertising columns in the past has been flagrant; much of it still is. Over the radio the public today often hears the most preposterous claims in the field of medication, presented by the seductive voices of those who pretend to speak with authority. The owners of Serutan sponsored a widely known newspaper columnist and radio commentator named Drew Pearson. Persons who cherish respectability should be expected to assure themselves of the reliability of their sponsorship, particularly when the health of the people is so directly concerned. Mr. Pearson so persistently refuses to correct misstatements of fact related to medicine when made in his newspaper column that it would apparently be futile to expect him to comment on the present state of knowledge regarding his former sponsor on the radio.

Correspondence

SUMMARY AND CONCLUSIONS

To the Editor:—This communication is to protest against a growing tendency among medical authors publishing papers in certain journals to append an incomplete table of contents and label it Summary and Conclusions. Thus:

1. The literature covering the important subject of whether two and two make four is thoroughly reviewed.
2. Certain evidence more or less bearing on this important subject is presented.
3. The significance of these findings is discussed.
4. Read it, you — —.

The journals published by the American Medical Association do not offend in this way and I know your teaching has been against it.

Yours for better summaries and conclusions.

TASKER HOWARD, M.D., Brooklyn.

ANTIMONY THERAPY IN CREEPING ERUPTION

To the Editor:—Dr. Dudley C. Smith's article in THE JOURNAL, Nov. 13, 1943, page 694, hardly called for a reply, as the literature to which he referred obviously was a limited one; but, as the article has given rise to the claim that antimony products other than fuadin have proved unsuccessful in the treatment of creeping eruption, may I refer you to early reports on their use appearing in various quarters and prompting my own warning, to which he referred, that not all cases respond to antimony therapy and may therefore not have the same causative organism:

Cawston F. Gordon: *J. Roy. Army M. Corps*, December 1929.

Cawston, F. Gordon: *J. Trop. Med. & Hyg.*, Aug. 15, 1928, pp. 209, 210.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Malpractice: Injury to Anesthetized Patient; Application of the Doctrine of Res Ipsa Loquitur.—The patient submitted to an appendectomy on Oct. 28, 1939 at a hospital owned by Dr. Swift. After he was wheeled to the operating room, according to the plaintiff, the anesthetist pulled his body to the head of the operating table, laying him back against two hard objects at the top of his shoulders, about an inch below his neck. The patient was then anesthetized and lost consciousness. When he came out of the anesthetic the following morning he felt a sharp pain about half way between his neck and his right shoulder, and diathermy treatments were given him for this pain while he remained in the hospital. The pain did not subside but spread down to the lower part of his arm, growing worse after his release from the hospital. He was unable to rotate or lift his arm and developed paralysis and atrophy of the muscles around his shoulder. According to another physician who subsequently treated him for this ailment, roentgenograms indicated an area of diminished sensation below the shoulder and atrophy and wasting away of muscles around the shoulder and, in the opinion of this physician, the patient's condition was due to trauma or injury by pressure or strain applied between his right shoulder and neck. Another physician, who had examined the patient probably for the purpose of testifying, testified that the patient's injury was a paralysis of traumatic origin, not arising from pathologic causes and not systemic, and that the injury resulted in atrophy, loss

of use and restriction of motion of the right arm and shoulder. Subsequently the patient brought suit against the operating physician, the anesthetist, the physician who owned the hospital at which the operation was performed, and the special nurse who attended him. At the conclusion of the evidence the trial court entered a nonsuit as to all the defendants, and the patient appealed eventually to the Supreme Court of California.

The patient contended that the evidence adduced by him at the trial court, substantially as stated, presented a proper case for the application of the doctrine of *res ipsa loquitur* and that the inference of negligence arising from the application of that doctrine made the entering of a nonsuit improper. The defendants, however, argued that, assuming the patient's condition was in fact the result of injury, there was no showing that the act of any particular defendant, or any particular instrumentality, was the cause thereof. Briefly stated, they defended on two theories: (1) that where there are several defendants and there is a division of responsibility in the use of an instrumentality causing the injury, and the injury might have resulted from the separate act of either one of two or more persons, the rule of *res ipsa loquitur* cannot be invoked against any one of them; and (2) that where there are several instrumentalities, and no showing is made as to which caused the injury or as to the particular defendant in control of it, the doctrine cannot apply. The doctrine of *res ipsa loquitur*, said the court, has three conditions: "(1) The accident must be of a kind which ordinarily does not occur in the absence of some one's negligence; (2) it must be caused by an agency or instrumentality within the exclusive control of the defendants; (3) it must not have been due to any voluntary action or contribution on the part of the plaintiff." Prosser, Torts, p. 295. It is applied in a wide variety of situations, including cases of medical or dental treatment and hospital care. There is, however, some uncertainty as to the extent to which the doctrine may be invoked in cases of injury from medical treatment. This is in part due to the tendency in some decisions to lay undue emphasis on the limitations of the doctrine and to give too little attention to its basic underlying purpose. The result has been that a simple, understandable rule of circumstantial evidence, with a sound background of common sense and human experience, has occasionally been transformed into a rigid legal formula, which arbitrarily precludes its application in many cases in which it is most important that it should be applied. If the doctrine is to continue to serve a useful purpose, we should not forget that "the particular force and justice of the rule, regarded as a presumption throwing upon the party charged the duty of producing evidence, consists in the circumstance that the chief evidence of the true cause, whether culpable or innocent, is practically accessible to him but inaccessible to the injured person." 9 Wigmore, Evidence, ed. 3, sec. 2509, p. 382; see also *Whetstone v. Moravec*, 228 Iowa 352, 291 N. W. 425; *Ross v. Double Shoals Cotton Mills*, 140 N. C. 115, 52 S. E. 121, 1 L. R. A., N. S., 298; *Maki v. Murray Hospital*, 91 Mont. 251, 7 P. (2d) 228. In the Maki case, in which an unconscious patient in a hospital received injuries from a fall, the court declared that without the doctrine the maxim that for every wrong there is a remedy would be rendered nugatory "by denying one, patently entitled to damages, satisfaction merely because he is ignorant of facts peculiarly within the knowledge of the party who should, in all justice, pay them."

The present case, continued the court, is of a type that comes within the reason and spirit of the doctrine more fully perhaps than any other. The passenger sitting awake in a railroad car at the time of a collision, the pedestrian walking along the street and struck by a falling object or the debris of an explosion, are surely not more entitled to an explanation than the unconscious patient on the operating table. Viewed from this aspect, it is difficult to see how the doctrine can, with any justification, be so restricted in its statement as to become inapplicable to a patient who submits himself to the care and custody of doctors and nurses, is rendered unconscious and receives some injury from instrumentalities used in his treatment. Without the aid of the doctrine a patient who received permanent injuries of a serious character, obviously the result of some one's negligence, would be entirely unable to recover unless the doctors and nurses in attendance voluntarily chose to disclose the identity of the negligent person and the facts establishing liability. See

Maki v. Murray Hospital, 91 Mont. 251, 7 P. (2d) 228. If this were the state of the law of negligence, the courts, to avoid gross injustice, would be forced to invoke the principles of absolute liability, irrespective of negligence, in actions by persons suffering injuries during the course of treatment under anesthesia. But we think this juncture has not yet been reached and that the doctrine of *res ipsa loquitur* is properly applicable to the case before us. The condition that the injury must not have been due to the plaintiff's voluntary action is of course fully satisfied under the evidence produced herein; and the same is true of the condition that the accident must be one which ordinarily does not occur unless some one was negligent. We have here no problem of negligence in treatment, but of distinct injury to a healthy part of the body not the subject of treatment, nor within the area covered by the operation. The decisions in this state make it clear that such circumstances raise the inference of negligence and call on the defendant to explain the unusual result. See *Ales v. Ryan*, 8 Cal. (2d) 82, 64 P. (2d) 409; *Broken v. Shortlidge*, 98 Cal. App. 352, 277 P. 134.

The argument of defendants, said the court, is simply that plaintiff has not shown an injury caused by an instrumentality under a defendant's control, because he has not shown which of the several instrumentalities that he came in contact with while in the hospital caused the injury; and he has not shown that any one defendant or his servants had exclusive control over any particular instrumentality. The defendants asserted that some of them were not the employees of other defendants, that some did not stand in any permanent relationship from which liability in tort would follow and that, in view of the nature of the injury, the number of defendants and the different functions performed by each, they could not all be liable for the wrong, if any. We have no doubt, answered the court, that in a modern hospital a patient is quite likely to come under the care of a number of persons in different types of contractual and other relationships with each other. For example, in the present case it appears that Drs. Smith, Spangard and Tilley were physicians or surgeons commonly placed in the legal category of independent contractors; and Dr. Reser, the anesthetist, and the defendant Thompson, the special nurse, were employees of Dr. Swift and not of the other doctors. But we do not believe that either the number or the relationship of the defendants alone determines whether the doctrine of *res ipsa loquitur* applies. Every defendant in whose custody the plaintiff was placed for any period was bound to exercise ordinary care to see that no unnecessary harm came to him, and each would be liable for failure in this regard. Any defendant who negligently injured him, and any defendant charged with his care who so neglected him as to allow injury to occur, would be liable. The defendant employers would be liable for the neglect of their employees; and the physician in charge of the operation would be liable for the negligence of those who became his temporary servants for the purpose of assisting in the operation. In this connection, continued the court, it should be noted that, while the assisting physicians and nurses may be employed by the hospital or engaged by the patient, they normally become the temporary servants or agents of the surgeon in charge while the operation is in progress, and liability may be imposed on him for their negligent acts under the doctrine of respondeat superior. Thus a surgeon has been held liable for the negligence of an assisting nurse who leaves a sponge or other object inside a patient, and the fact that the duty of seeing that such mistakes do not occur is delegated to others does not absolve the doctor from responsibility for their negligence. See *Ales v. Ryan*, 8 Cal. (2d) 82, 64 P. (2d) 409; *Armstrong v. Wallace*, 8 Cal. App. (2d) 429, 47 P. (2d) 740; *Ault v. Hall*, 119 Ohio St. 422, 164 N. E. 518, 60 A. L. R. 128; and see also *Maki v. Murray Hospital*, 91 Mont. 251, 7 P. (2d) 228. It may appear at the trial that, consistent with the principles outlined, one or more defendants will be found liable and others absolved, but this should not preclude the application of the rule of *res ipsa loquitur*. The control at one time or another of one or more of the various agencies or instrumentalities which might have harmed the plaintiff was in the hands of every defendant or of his employees or temporary servants. This, we think, places on them the burden of initial explanation. The plaintiff was

rendered unconscious for the purpose of undergoing surgical treatment by the defendants; it is manifestly unreasonable for them to insist that he identify any one of them as the person who did the alleged negligent act.

The other aspect of the case, continued the court, that the defendants so strongly emphasize is that the plaintiff has not identified the instrumentality any more than he has the particular guilty defendant. Here again there is a misconception, which, if carried to the extreme for which the defendants contend, would unreasonably limit the application of the *res ipsa loquitur* rule. It should be enough that the plaintiff can show an injury resulting from an external force applied while he lay unconscious in the hospital; this is as clear a case of identification of the instrumentality as the plaintiff may ever be able to make. Under the present facts there can be no justification for the rejection of the doctrine of *res ipsa loquitur*. If we accept the contention of the defendants there will rarely be any compensation for patients injured while unconscious. A hospital today conducts a highly integrated system of activities, with many persons contributing their efforts; e. g., preparation for surgery by nurses and interns who are employees of the hospital; administering of an anesthetic by a physician who may be an employee of the hospital, an employee of the operating surgeon or an independent contractor; performance of an operation by a surgeon and assistants who may be his employees, employees of the hospital or independent contractors; and post-surgical care by the surgeon, a hospital physician and nurses. The number of those in whose care the patient is placed is not a good reason for denying him all reasonable opportunity to recover for negligent harm. It is rather a good reason for reexamination of the statement of legal theories which supposedly compel such a shocking result. We do not at this time undertake to state the extent to which the reasoning of this case may be applied to other situations in which the doctrine of *res ipsa loquitur* is invoked. We merely hold that, where a plaintiff receives unusual injuries while unconscious and in the course of medical treatment, all those defendants who had any control over his body or the instrumentalities which might have caused the injuries may properly be called on to meet the inference of negligence by giving an explanation of their conduct.

Accordingly, the judgment of nonsuit in favor of all the defendants was reversed.—*Ybarra v. Spangard*, 154 P. (2d) 687 (Calif., 1944).

COMING EXAMINATIONS AND MEETINGS

BOARDS OF MEDICAL EXAMINERS

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

Examinations of the boards of medical examiners and boards of examiners in the basic sciences were published in *THE JOURNAL*, March 17, page 673.

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: Part III. Various centers, June. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF INTERNAL MEDICINE: *Written*, Oct. 15. Final date for filing application is Aug. 1. Candidates in the armed forces may take the examination at their station with the permission of their medical commanding officer. Asst. Sec., Dr. W. A. Werrell, 1301 University Ave., Madison 5, Wis.

AMERICAN BOARD OF OBSTETRICS & GYNECOLOGY: *Part II. Oral*, Atlantic City, June 13-19. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh 6.

AMERICAN BOARD OF OPHTHALMOLOGY: New York, June 13-16; Chicago, Oct. 4-6; and Los Angeles, January. Sec., Dr. S. Judd Beach, 56 Ivie Rd., Cape Cottage, Me.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY: *Part I. Oral and Written*, New Orleans, Sept. 28-29. New York, Oct. 5-6, Chicago, Oct. 12-13 and San Francisco, Oct. 19-20. Final date for filing application is August 1. Sec., Dr. G. A. Caldwell, 3503 Prytania St., New Orleans 15.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 3-6. Sec., Dr. Dean M. Lierle, University Hospital, Iowa City, Ia.

AMERICAN BOARD OF RADIOLOGY: *Oral*, New York, June 3. Final date for filing application is May 1. Sec., Dr. B. R. Kirklin, 102-110 Second Ave. S.W., Rochester, Minn.

AMERICAN BOARD OF UROLOGY: *Written*, Chicago, Dec. 9. *Oral*, Chicago, Feb. 19-22. Sec., Dr. Gilbert J. Thomas, 1409 Willow St., Minneapolis 4.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1935 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Improving the Coronary Circulation.—Among the poor in the rural mountainous sections of Puerto Rico Amadeo observed a high incidence of anemia due to Uncinaria and to protein deficiencies in the diet. These anemic peasants walked several miles up and down hill with great ease. It seemed impossible for any heart to stand the enormous double strain of severe anemia and violent exercise. Furthermore, among 1,565 white poor patients over 45 years of age from these rural areas observed in his general medical practice during four years there was not a single case of angina pectoris due to coronary disease, whereas among 453 white well-to-do patients over 45 observed during the same four years there were five deaths from coronary disease. The two groups belong to the same race (white Puerto Ricans) and live in the same geographic environment (1,500 to 2,500 feet above the sea level). They differ only in the uncinariasis (ancylostomiasis) and anemia. Observations, and particularly a search for hemic murmurs, convinced the author that the hearts of the poor peasants compensate and preserve functional efficiency in the presence of anemia without weakening, dilating or developing hemic murmurs. The author suggests that moderate, temporary anemia may exert a beneficial effect on the heart by compelling it to develop some compensatory mechanism that continues to function throughout life and allows the heart to tolerate the myocardial anoxia that develops from subsequent anemias, as well as from exertion or coronary sclerosis.

Increased Capillary Fragility in Hypertension.—Griffith and Lindauer measured the capillary fragility by means of the petechial index of Göthlin in patients with hypertension. They found that capillary fragility was increased in about 18 per cent of 265 cases of hypertension. Persons with increased capillary fragility were especially predisposed to apoplexy, retinal hemorrhage and death. Thiocyanate increased an abnormal fragility already present and in certain cases caused an increase in a normal fragility. When this occurs, thiocyanate may be a factor in the causation of apoplexy and other hemorrhagic phenomena. Hesperidin and hesperidin methyl chalcone restored increased capillary fragility to normal in about 84 per cent of

cases. These drugs may reduce the frequency of the complications of increased capillary fragility. Thiocyanate should not be given to persons with increased capillary fragility until that fragility has become normal as the result of treatment.

Salicylate Intoxication.—Fashena and Walker report the occurrence of salicylate poisoning during the treatment (by the Coburn method) of a patient with acute rheumatic fever. After the acute rheumatic fever had been diagnosed, the patient, a Negro boy aged 9 years, was given 6 Gm. of sodium salicylate daily. After four days of this treatment all evidence of involvement of the joints had disappeared, but when administration of the drug was stopped pain appeared in both shoulders and in the joint of the right elbow. Four days later, administration of sodium salicylate in oral doses of 8 Gm. a day was resumed, with prompt disappearance of the symptoms in the joints. After forty-eight hours of drug therapy at this higher level the patient developed hyperpnea. Nausea and vomiting appeared on the third day of therapy at the higher level, and disorientation and hallucinations supervened on the sixth day. On the seventh day the patient appeared gravely ill. The hyperpnea showed no response to oxygen or to change in posture. Examination of the blood revealed hypoprothrombinemia, which was partially controlled by daily parenteral doses of 1 mg. of synthetic vitamin K. The authors report experimental studies on the blood salicyl level in 6 children. To achieve blood salicyl levels of the order of 350 micrograms per cubic centimeter, sodium salicylate has to be administered in amounts which border on toxic doses for children. Evidence suggests that after an initial twenty-four hour period of large doses the amount given may be reduced without subsequent diminution in blood salicyl level. It is desirable that the Coburn treatment for rheumatic fever be controlled by repeated estimations of the blood salicyl level in order to attain maximum therapeutic effectiveness with minimal doses. Sodium salicylate regularly induces hypoprothrombinemia, which may regress spontaneously as treatment continues. Large doses of vitamin K appear to prevent the development of prothrombin deficiency and to hasten its restoration to normal levels when the deficiency is already present. Sodium salicylate as well as other compounds of salicylic acid should be administered to children with due regard for the hypoprothrombinemia and the acid-base changes which they may produce without overt signs. The concomitant administration of vitamin K is indicated.

Unrestricted Activity in Primary Tuberculosis.—Levine reviews data that were accumulated during an investigation on tuberculosis in childhood, carried on from 1926 to 1942 in New York City. Ninety infants were observed before, during and after their primary complex. Twenty-seven of these had the primary pulmonary lesion with perifocal infiltration and went through the active phase of primary complex before they were 12 months of age. These infants were classified as nonambulatory; 16 of them died from tuberculosis and 1 had tuber-

culosis of the hip. All except 3 of the 63 remaining infants were ambulatory throughout the primary complex in spite of the size of the pulmonary infiltration. Of these 60 ambulatory patients only 4 died from tuberculosis and only 2 had complications—tuberculosis of the cervical nodes in 1 instance and multiple hematogenous lesions in the other. Of the 3 hospitalized patients 1 died from tuberculosis and 1 had tuberculosis of the spine. Rest in bed did not influence the course of the primary complex or reduce the incidence of complications, nor was there evidence that lack of rest in bed was detrimental. The age of the child at the time of infection rather than the method of treatment seems to be the important factor in determining prognosis. Contact with a tuberculous mother during the first year was much more dangerous than contact with a tuberculous father. Rest in bed during a primary infection with tuberculosis should be limited only to the period of elevation of temperature, as in the treatment of any febrile condition during childhood.

Review of Urologic Surgery. A. J. Scholl and others—p. 415.

Paralysis of Larynx After Carcinoma of Breast.—Fox reports 6 cases of surgically treated cancer of the breast in which a period of complete symptomatic freedom from disease followed mastectomy. This period varied from fourteen months to twelve years. The patient's well-being was then suddenly interrupted by changes in the voice, described as persistent hoarseness or huskiness. There were also intermittent weakness of the voice, a tendency for the voice to crack and a nonproductive cough, unaccompanied by evidence of infection of the respiratory tract. Dyspnea was severe in 1 patient and was experienced on exertion by the others. In each instance it was the laryngeal disturbance which caused the patient to consult her physician. Hoarseness occurring after radical mastectomy for carcinoma of the breast is often the first clinical evidence of metastasis. Metastasis from carcinoma of the breast causes paralysis of the recurrent laryngeal nerve on the same or on the opposite side by involving the chain of lymph nodes surrounding the recurrent laryngeal nerve.

Regional Ileitis or Enteritis. L. Felner—p. 412.

Hepatotoxic Effects of Chlorinated Hydrocarbons.—A man aged 50, while working in a defense plant, had been exposed to the fumes of Halowax, a chlorinated hydrocarbon. After three months of exposure he developed a Halowax dermatitis and three months later, that is, six months after exposure to the fumes, he became jaundiced and was hospitalized. He died two months later. The cause of death was cirrhosis of the liver due to subacute necrotizing hepatitis (acute yellow atrophy of the liver). This case led to an investigation of the literature on the toxic effects of exposure to the various chlorinated hydrocarbons. Strauss discusses animal experiments and reviews Drinker's observations on 3 workers of the Halowax Corporation who died of jaundice following exposure to Halowax. He cites a report by Greenburg and his associates of 3 workers dying of acute yellow atrophy following occupational exposure to chlorinated naphthalenes. He also cites a nonfatal case of poisoning by chlorinated naphthalenes. The clinical histories of 5 patients with a history of exposure to the fumes of chlorinated hydrocarbons are presented. All showed a drop in the serum albumin and total proteins. The author stresses that if a worker develops jaundice or Halowax dermatitis he should be immediately removed from possible contact with the vapors of the chlorinated hydrocarbons. He should be placed on a high protein diet and given several transfusions of either whole blood or plasma. He should never be permitted to return to the same occupation or to one that subjects him to the inhalation of carbon tetrachloride or its allied compounds.

Stress Fractures of the First Rib.—In 55,451 routine fluorographic examinations at a naval establishment, Alderson observed 35 men who had a condition in one or both of their first ribs which at first, for want of a better term, was described as "an anomaly of the first rib." The appearance of the lesion varied considerably in most respects except its situation, which was invariably just proximal to the scalene tubercle. Some of the cases showed an irregular transverse or oblique break in the continuity of the rib associated with a fusiform swelling around the lesion, showing the radiologic characteristics of callus in varying degrees of formation. Others appeared to be of much longer standing, and the surrounding swelling appeared to be fully formed bone. Each patient was interrogated as to history and symptomatology. The sixteenth patient first gave the elements of credence to the hypothesis that the condition might be related in its etiology to other types of stress fracture. Only 5 patients volunteered significant symptoms and history. Of these, 2 gave a history of "sudden pain in the shoulder" occurring shortly after strenuous physical training, 2 admitted direct trauma some years previously, and the fifth stated that prior to entry into the service he had carried 1 cwt. (51 Kg.) bags of coal on his shoulder and had complained of a sore shoulder for the first week or two. The evidence suggests that the abnormality is a stress fracture of the first rib.

Epithelial Changes in Fluorosis.—Spira says that the action of fluorine is known to consist in its ability to precipitate calcium salts stored in the body, material indispensable for sustaining the vitality of most of the organic functions. The protracted ingestion of toxic amounts of this halogen may bring about the reduction of calcium in both blood and tissues to a dangerous level. The lesions may be produced by fluorine

attacking tissues directly, or fluorine may interfere with the normal function of the parathyroids. Spira asserts that fluorine is contained in aluminum cooking utensils and in drinking water. The action of fluorine consists in lowering the level of the calcium in the blood and tissues. The epithelium of the mouth and the salivary glands, of the nasopharynx, the conjunctivas and the lacrimal glands may be affected. Signs and symptoms are thus produced which are closely similar to those usually attributed primarily to infection. It is suggested that an infection accompanying chronic fluorine poisoning is of a secondary nature and that it is brought about by the loss of calcium in the body.

Tropical Diseases in Returned Soldiers.—Turnbull stresses that tropical diseases which Australians contracted in the war in New Guinea will force themselves on the attention of the practitioner at home. The present routine course of treatment followed by 0.1 Gm. of atabrine per day for six weeks will produce cure of malignant tertian malaria in almost 100 per cent of cases. This does not apply to benign tertian malaria; there is no drug that will cure this infection, although the routine treatment rarely fails to terminate an attack and the maintenance course of atabrine will stave off early relapse. Every soldier who lands in Australia from New Guinea or the islands is given a supply of atabrine sufficient to last for six weeks, with instructions to take one tablet every day. If he does this he will not die of malignant tertian malaria, and he almost certainly will not develop an attack of benign tertian malaria, though a relapse due to benign tertian is likely to develop about three weeks after he stops taking his drug. If, however, he is careless and fails to take his tablet each day, he is likely to have a malarial attack which may be a sudden and intense cerebral attack or some other form of malignant tertian infection producing a rapidly fatal result. This has happened in 4 or 5 cases, and other men have been admitted urgently to military hospitals and saved by prompt and vigorous treatment. It is therefore important that all medical practitioners should aid by stressing this danger to all whom they can influence, because many men are encouraged by their friends and relatives to give up taking their tablets under the plea that they are harmful or unnecessary. Two statements gave some trouble. These were that (1) atabrine will cause sterility in some men who take it and (2) atabrine damages the liver. There is no evidence in favor of either statement. If all doctors preach the great importance of continuing suppressive treatment with atabrine, tragedies and near tragedies from cerebral malaria will be reduced greatly. When a man is infected with malaria many things tend to cause an attack, such as chill, cold bathing, another illness, blood loss, anesthesia and operation, and such relapses are apt to occur for a period of three years or more after the patient leaves a malarious area.

Book Notices

Principles and Practices of Inhalational Therapy. By Alvan L. Barach, M.D., Associate Professor of Clinical Medicine, Columbia College of Physicians and Surgeons, New York. Fabrikoid. Price, \$4. Pp. 315, with 59 illustrations. Philadelphia, London & Montreal: J. B. Lippincott Company, 1944.

This is the first complete handbook on inhalational therapy written by a physician with wide experience in the application of physical principles to clinical medicine. The first chapter deals with the historical and physiologic background of the therapeutic use of oxygen, carbon dioxide, helium, positive pressure, lung immobilization and vaporized solutions of epinephrine and neosynephrine. In the next thirty chapters the author discusses the pathologic physiology and specific inhalational treatment of various diseases, including pneumonia, pulmonary edema, congestive heart failure and bronchial asthma. Methods of inhalational therapy and technics of gas analysis are described in the last seven chapters, with clear illustrations and practical guidance in the choice of apparatus. The book will be useful to physicians and technicians who are responsible for the therapeutic use of gases in clinical medicine and in many phases of war medicine as well.

Manual of Human Cross Section Anatomy. By Dudley J. Morton, M.D., Associate Professor of Anatomy, Department of Anatomy, College of Physicians and Surgeons, Columbia University, New York. Second edition. Cloth. Price, \$6. Pp. 211, with illustrations. Baltimore: William Wood & Company, 1944.

The second edition of this popular manual of human cross section anatomy retains all of the material included in the first and contains several additions for the convenience of the student. A much smaller and more compact volume than the first edition, it nevertheless contains reproductions of ninety cross sections through the head and neck, thorax and abdomen, female abdomen and pelvis, upper extremity, thigh and leg, ankle and foot, sixteen key figures and forty-one pages for notes, including seven pages with outline drawings for recording sensory areas of the skin and arterial anastomoses about joints.

The manual is designed for flexibility of use either by the individual student or for a formal class, to provide a personal reference work book for the student and to stimulate the student to think in terms of three dimensional relationships with the minimum of time and effort.

If used under proper supervision in connection with adequate material and reference books, this manual may be of some value as one of many accessories in the teaching of cadaver anatomy. As a reference book the manual has certain defects: Sometimes successive cross sections are too far apart for completeness and to indicate continuity and relationships in the third dimension; the specimen used for the female pelvis is abnormal or atypical. As a work book the manual is in the nature of a picture puzzle book, requiring little thought or effort on the part of the student.

The aim of anatomy is the knowledge and understanding of the structural relationships of the living human body. Only the dead body can be completely dissected, and the cadaver relationships must be interpolated into the living condition. Modern roentgenologic methods have made this possible, whereas cross sections serve to emphasize the cadaver relationships and so have receding value in the modern teaching of anatomy. Consequently such a manual of cross section anatomy, though it makes the interpretations of cross sections easy and interesting, will be of minor value except where a lack of material, modern equipment or time for the thorough study of anatomy exists.

Proteins and Amino Acids: Physiology, Pathology, Therapeutics. Cloth. Grátis to Medical Profession. Pp. 189. Yonkers, New York: Arlington Chemical Company, 1944.

This little book has been prepared to present a comprehensive digest of the known facts concerning the participation of protein in body processes. The important contributions on protein found in the literature up to June 1944 are effectively organized under subject headings and the essential facts from the original works accurately reported. The first sections deal with the physiology of protein and establish a basis of understanding for the cause-relationship and therapeutic usage of

protein in disease conditions which is discussed later. Editorial discussion and opinion based on information gained in reading the extensive bibliography and from conferences with the leaders in the various fields convey the information to the reader in a simple, easily read manner. The main objective of the monograph is to bring together the impressive amount of data on the importance of adequate protein supplies in the treatment of numerous disease conditions. This purpose is well served. The factual information, briefly and concisely presented, as well as the extensive references found in this book should make it attractive to the physician and nutritionist.

The Measurement of Adult Intelligence. By David Wechsler, Chief Psychologist, Bellevue Psychiatric Hospital, New York. Third edition. Cloth. Price, \$3.50. Pp. 253, with 12 illustrations. Baltimore: Williams & Wilkins Company, 1944.

One of the most serious criticisms of earlier editions of this well known and accepted battery of intelligence tests devised for adults rather than for children was that the tests given were not standardized on a sufficient number of persons. This situation has now been corrected to some extent, but the type of cases used leads to statistical misinterpretations. In addition there are some defects in the author's concepts of test formation, particularly the idea that there is such a thing as mental alertness that can be measured. Wechsler argues that his test is a good measure of intelligence because experience has shown it to be so, and the experience of the reviewer is that this is not an acceptable statement. In many instances the test results are too high when weighed against the psychiatric evaluation. The fact that the test is weighted for adults causes the author to make certain concessions which are not acceptable: the slightly deteriorated or elderly adult reacts higher than his actual mental function. Mental defectives are also rated higher than they would be on other tests, and most clinical psychiatric evaluations indicate that the Wechsler examination rates defective persons too high. The test procedure and the criteria for evaluating the answers are included in the book. For the skilled examiner who can select tests effectively to suit various problem individuals, the Wechsler test is a very satisfactory one. For general use the psychiatrist might well be cautious in accepting results obtained by any but the most highly trained clinical psychologist.

Diagnóstico topográfico de los procesos pleuropulmonares: Estudio anatómico, clínico y radiológico. Por el Dr. Juan Soto Blanco, profesor agregado de cirugía, cirujano del Instituto. Facultad de medicina de Montevideo, Instituto de fisiología "Prof. Dr. J. B. Morelli." Colección de monografías. Monografía N° 1. Paper. Pp. 106, with illustrations. Montevideo, 1944.

This is one of a collection of monographs published under the auspices of the Dr. J. B. Morelli Institute of Tuberculosis of the Faculty of Medicine of Montevideo. Much valuable radiologic research has been done in the University of Montevideo. The findings in the present research do not suggest any need of change in our conceptions of the anatomic divisions of the lung and their landmarks as seen on the roentgenograms. The numerous interesting cases reported and illustrated by anatomic and radiographic demonstrations emphasize the fact that the postoperative result of pleuropulmonary surgical operations is in great part dependent on correct topographic and etiologic diagnosis. An understanding of the bronchial system is of the greatest importance. For this the author uses bronchography, with screen and film studies in multiple positions.

Family Health Service in Tuberculosis: A Supplement to Guide No. 3 on Tuberculosis. Family Health Series Guide for Public Health Nurses No. 3A. Paper. Pp. 47, with illustrations. New York: Community Service Society, Department of Educational Nursing, 1944.

This is a pictorial representation in posed photographs of the work of the public health nurse in the handling of a case of open tuberculosis in which a delay is encountered in finding sanatorium accommodations. Home technics for the avoidance of infection are demonstrated. The role of the nurse in arranging sanatorium care and the necessary social services is explained. It is a good job of clear exposition. The photography is good and the brief accompanying captions are clear and concise. The pamphlet should be of use to public health agencies dealing with tuberculosis and to physicians in the same field.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

HAZARDS OF TONSILLECTOMY AND ADENOIDECTOMY

To the Editor:—Can you give me any data on the number of deaths per year in the United States caused by tonsillectomy? In my opinion there are too many tonsillectomies and adenoidectomies being performed, and too many doctors consider this operation without danger and tell the parents so. Lee K. Emenhiser, Lieutenant Colonel, M. C., A. U. S.

ANSWER.—The figures requested are not readily available. Life insurance company statistics are not very informative, and the Bureau of the Census states that exact figures on the number of deaths caused by tonsillectomies each year cannot be supplied, partly because no distinction is made in the classification of cause of death between tonsillitis and postoperative complications of tonsillectomy. Failure to separate deaths among children from those among adults and failure to separate those due to local anesthetics as distinguished from those due to general anesthetics makes reporting difficult. However, Fowler states that in a group of approximately 250,000 tonsil and adenoid operations performed in all parts of the United States between the years 1915 and 1925 there were thirty-three deaths which occurred within twenty-four hours after operation. Four of these deaths were due to injection of cocaine and four were due to injection of some other local anesthetic. Three deaths followed general anesthesia (type of anesthetic used not stated). The chief cause of death was hemorrhage, of which there were fourteen instances; other causes were the cutting of the internal carotid artery and the cutting of anomalous blood vessels; embolism and epilepsy accounted for six deaths.

If one assumes that the inquiry relates chiefly to children and deducts those deaths due to the use of local anesthetics, there is a still smaller number, assumed to be children, who die within the first twenty-four hours after operation; roughly, less than 1 in 10,000. There are of course later deaths from pneumonia, lung abscess and other causes, but there is no way of getting accurate figures in these cases.

Tonsillectomy and adenoidectomy are the most commonly performed surgical procedures in the United States. It is perhaps true that they are frequently recommended when proper indications do not obtain, and it is also true that these operations are not lacking in danger. Even if death is not common following the operation there are complications which are not pleasant, chief among which is hemorrhage, which may reduce the patient's vigor and health for weeks afterward.

Hence tonsillectomy and adenoidectomy is not different from any other surgical intervention and should not be undertaken without adequate reason.

HEMOCHROMATOSIS

To the Editor:—I have a patient whose condition has been diagnosed as hemochromatosis (bronze diabetes). Kindly supply information on latest treatment. Andres Vesalio Guzman, M.D., Cartago, Costa Rica.

ANSWER.—Treatment aims to control symptoms resulting from destruction of the islands of Langerhans in consequence of hemochromatosis. In some cases the extent of the destruction of the islands is minimal, in others extreme, so that the dosage of insulin is most variable, 20 to 1,680 units being the range in the series of 19 cases reported by the Joslin group. The same holds true for the diet, but in general one endeavors, as in all cases of disease of the liver, to store glycogen in that organ and therefore, compared with the fat, the carbohydrate and indeed the protein in the diet are high and the fat is low. In cases of severe anemia liver extract may be helpful, and if hydrochloric acid is deficient in the gastric secretion it should be administered. In some patients because of the associated testicular atrophy testosterone has been tried. Vitamins A and B as recommended by Wilder may be useful as will other and vitamins, but other than what is mentioned one must depend on symptomatic treatment. One should not be too pessimistic about the outcome. A patient with hemochromatosis may live for years.

EPIDEMIC DIARRHEA AND VOMITING

To the Editor:—I have read with interest an article in the Jan. 6, 1945 issue of The Journal regarding epidemic diarrhea, nausea and vomiting of unknown cause in Philadelphia. Recent observations during an epidemic of infectious mononucleosis prompt me to write to present the question of the possibility of infectious mononucleosis being present in the epidemics described. Can this be ruled out? The heterophile antibody test used as a criterion in this disease was recorded as being done in only 6 cases and was reported simply as "negative." The differential white cell counts are not reported. The symptoms as described fit loosely into a large group of known and unknown conditions, among which would appear to be included a certain number of cases of infectious mononucleosis with predominantly gastrointestinal manifestations.

Stanton S. Eddy Jr., M.D., Middlebury, Vt.

ANSWER.—It is true that "the symptoms as described fit loosely into a large group of known and unknown conditions." Nausea, vomiting and diarrhea are, of course, among the most common symptoms of many infectious diseases including infectious mononucleosis, but when they occur as the predominant symptoms in almost all patients with an epidemic disease it is reasonable to regard that disease as an entity or at least a syndrome. It is by such reasoning that progress in nosology is made, often long before the specific cause is discovered. The situation was quite the same when the viral pneumonias were separated from the large indeterminate group of infections of the respiratory tract in 1938.

It is unlikely that the authors of the paper referred to and all the authors of the reports referred to in the paper, and the discussers, were mistaken in their diagnoses. In none of the patients studied were changes in the blood characteristic of infectious mononucleosis encountered; in none were the lymph nodes or spleen swollen; in none were severe sore throat, pain in the neck or joints, eruptions of the skin, jaundice, conjunctivitis or illness of two to three weeks ever noted. How else can infectious mononucleosis "be ruled out" without knowing the exact cause or other specific tests in either disease?

CATHARTICS AND POLIOMYELITIS

To the Editor:—We are undergoing our second epidemic of poliomyelitis within the past few years here in Laurel, Md. I have seen 3 cases this year, all verified by spinal tap and hospitalized. The first child was already showing signs of foot drop and was hospitalized immediately. The next 3 cases were seen at the onset and were treated at first on the basis of their symptoms of enterocolitis with a dose of calomel and phenolphthalein followed by a saline laxative. Their symptoms were greatly relieved, and though their fever persisted for a while they did not develop any weakness. The fifth case was seen on the second day, and a tentative diagnosis of poliomyelitis was made. Since the child, a girl of 12 years, had had saline purges on the two previous days, I waited another day before giving calomel. Her temperature had continued at 101 F. in spite of acetylsalicylic acid, and her headache and leg pain were not relieved until after 1 grain (0.065 Gm.) each of calomel and phenolphthalein had been given followed by magnesium magma the next morning. This was the fourth day of her illness. There was the same definite improvement of temperature, pain, muscular spasm and anxiety that was noted in the other cases. Her condition remained good, but she was later hospitalized for isolation and residual muscle spasm, as were the others. There was a slight foot drop of one foot in this case, which later improved. This may have been due to the fact that calomel was not administered until the third day after the onset of the illness. Has this therapy been used before? Does not the emptying of the entire gastrointestinal tract with calomel and phenolphthalein seem to be rational early treatment in view of the consistent finding of the virus in the excreta of the victims in epidemic areas by research groups such as Trask and Paul (Am. J. Pub. Health 31:239 [March] 1941)?

John M. Warren, M.D., Laurel, Md.

ANSWER.—The number of cases treated by calomel and phenolphthalein is too few from which to draw any definite scientific conclusions. After clinical manifestations have presented themselves, poliomyelitis is much like the other virus diseases, such as measles, chickenpox, mumps and smallpox. None of these diseases can be altered in any way by drugs, chemical or serum, and the possible removal of virus from the alimentary canal cannot affect virus already in the central nervous system. There is no evidence that a purge completely cleans the alimentary canal of virus. The 3 consecutive cases of poliomyelitis referred to might easily all be nonparalytic regardless of any treatment, while the next 5 might all be serious and perhaps even fatal. Many authorities who specialize in the treatment of poliomyelitis patients believe that the giving of drastic purges to such patients is not without danger. Cathartics, in cases in which an inability to empty the bladder and bowel has developed, many times cause increased peristalsis and abdominal cramps, often harming the patient's ability to empty the bowel.
